

VE-Cadherin

Figure S2. Immunolocalization of VE-Cadherin in co-cultures of TNBC cells and endothelial cells. HCC1806 and EA.hy926 cells were co-cultured for 48 h. Then, cells were fixed and processed for immunocytochemistry. The primary antibody anti-VE-Cadherin was made in mice. Incubations were undertaken overnight at 4°C. The secondary antibody was goat anti-mouse-Cyanine3 (red channel) Cells were photographed with a conventional fluorescence microscope. Representative 20x images are shown.
