## Abstract

Artificial intelligence has become one of the major driving forces for business change in the modern business world. This study focuses on the link between marketing strategies, such as social media marketing and content marketing, and business sustainability, and on the role of artificial intelligence as a mediator for SMEs in Nablus. This research used a survey design based on 373 employees working for SMEs mainly based in Nablus. This research used exploratory and confirmatory factor analyses to validate the measurement model, and structural equation modeling and SPSS v.25 PROCESS macro analysis to verify the proposed relationships. This research found that marketing strategies positively link to business sustainability; the strongest direct link was found for content marketing. Artificial intelligence also significantly mediated the relationships between social media marketing and content marketing and business sustainability. This research highlights the importance of incorporating artificial intelligence into marketing strategies to improve the effectiveness of marketing strategies and support decisions for enhancing business sustainability for SMEs in emerging economies.

**Keywords:** marketing strategies; social media marketing; content marketing; artificial intelligence; business sustainability

## 1. Introduction

In the present era of rapid technological advancements and globalization, Artificial intelligence (AI) has become the leading force in different domains of society, transforming the way organizations function [1,2]. AI has been recognized as a technology with the potential to change the way businesses operate and the way value is created [3]. Both academia and practitioners recognize AI as a key driver of future development in society and the economy [4,5]. Even though AI has proved its potential to increase productivity in various industries, marketing has been identified as the function of business that has been impacted the most by AI [6,7]. The survey conducted by McKinsey & Company on AI use cases in 19 different industries with more than 400 use cases identified that the highest potential value creation from AI implementation lies in marketing and sales [8].

To situate this study within the broader socioeconomic context of Palestine, it is important to recognize the central role of SMEs in the local economy. According to the Palestinian Central Bureau of Statistics (PCBS), approximately 99% of enterprises are SMEs, employing around 82% of the workforce, underscoring their critical contribution to employment and economic activity [9]. Digital technology adoption among these firms is gradually increasing, with a substantial proportion using computerized systems in operations and some integrating ICT into their business processes [10]. However, the Palestinian economy has faced significant challenges in recent years, with press reports indicating contractions in economic output and increases in unemployment, reflecting the dynamic and often volatile operating environment for SMEs. These statistics provide critical context for understanding the conditions under which SMEs are adopting AI and digital marketing strategies.

However, with the changing environment and increasing level of competition, organizations are being forced to adopt a data-driven approach to decision-making to sustain their competitive advantage [11]. The changing environment and increasing level of competition require organizations to make swift strategic decisions to cope with the challenges of changing consumer behavior and digital competition. In this regard, many organizations are adopting advanced technologies like AI to enhance their productivity and decision-making to sustain their competitive advantage [12]. The emergence of a large amount of data and the limitations of resources require organizations to adopt AI to cope with the challenges of changing environmental dynamics. The adoption of AI by many organizations is also driven by the aim of emulating digital leaders [13]. By incorporating AI into strategic decision-making processes and aligning it with organizational objectives, many organizations aim to attain long-term success and sustain their competitive advantage [11,14]. In today's changing environment, organizational flexibility has also emerged as a key determinant of success for organizations [15].

The integration of artificial intelligence in marketing has profoundly affected the formulation, implementation, and assessment of marketing strategies, signifying a new era of innovation and strategic growth in marketing [16,17]. AI-based marketing strategies, such as social media marketing and content marketing, are increasingly used for improving marketing effectiveness [18]. Social media platforms, for instance, create a huge volume of consumer information, which can be analyzed using AI technologies to identify consumer behavior, factors influencing consumer behavior, and consumer response to marketing content [5]. With such information, marketing strategies can be optimized, marketing campaigns can be automated, brand sentiment can be monitored in real-time, and marketing communication can be personalized [19]. As a result, marketing effectiveness can be enhanced, digital presence can be strengthened, interactions with consumers can be improved, and innovative marketing practices, such as influencer marketing, can be explored.

Despite the rising trend in AI-based marketing, a comprehensive understanding of AI integration in marketing practices in diverse organizational settings is still lacking [2]. The existing body of research has primarily focused on specific AI-based marketing practices, such as AI-based advertising or consumer engagement, which often fails to consider organizational implications, offering little information on how AI can be used for organizational success [5,20]. Although AI-based marketing is rising in marketing practices, its contribution to organizational sustainability is still lacking a comprehensive understanding [21]. Although previous studies have identified AI as a factor contributing to marketing effectiveness, research focusing on AI integration with sustainability is fragmented, resulting in a lack of understanding of AI integration in marketing with organizational sustainability [22]. Previous research on AI and sustainability is mostly fragmented and focused on these two concepts as separate fields of inquiry, rather than examining the influence of AI adoption on business sustainability (BS), particularly in times of organizational change [23,24].

Sustainability in the business context refers to the ability of organizations to operate and create value over the long term while balancing economic performance, environmental responsibility, and social well-being. The concept is commonly conceptualized through the triple bottom line framework, which emphasizes that sustainable organizations should simultaneously pursue economic viability, environmental protection, and social equity [25]. From a strategic perspective, BS involves maintaining long-term competitiveness and operational continuity while managing economic, environmental, and social risks and opportunities [26]. Although sustainability encompasses multiple dimensions, this study focuses primarily on the economic dimension of BS, as financial stability and long-term competitiveness are essential for the survival and growth of small and medium-sized enterprises (SMEs). BS is typically conceptualized through three interrelated dimensions: economic, environmental, and social sustainability. Economic sustainability refers to the ability of firms to maintain long-term financial performance and operational continuity, while environmental and social sustainability address ecological responsibility and societal well-being. Although all three dimensions are important for sustainable development, the present study focuses

primarily on the economic dimension of BS, as financial stability and long-term competitiveness represent critical challenges for SMEs operating in emerging economies.

As sustainability is integrated into organizational strategies, there is an increasing necessity for research on how AI contributes to sustainable business outcomes [27,28]. Without further empirical research, businesses run the danger of not leveraging the full potential of AI in advancing sustainability outcomes. Furthermore, businesses have been known to face difficulties in adopting AI technologies due to organizational issues, including skill deficiencies, difficulties in implementation, and technology readiness [29], which further emphasizes the necessity of better guidance on leveraging AI adoption for BS [30]. Furthermore, research on the influence of AI on digital marketing strategies, including social media and content marketing, is also lacking, and how AI affects digital marketing strategies is not well understood [31]. As such, the general implications of AI adoption in digital marketing strategies on BS have also not been well explored [32,33]. This is also compounded by the increasing gap between businesses' interest in AI and its adoption in digital marketing strategies [34,35].

In this sense, this research aims to fill the aforementioned gaps by combining artificial intelligence, marketing strategies, and BS in a single empirical framework, focusing on small and medium-sized enterprises (SMEs) in an emerging economy context. As such, this research explores the relationships between marketing strategies such as social media marketing and content marketing and BS, as well as the role of artificial intelligence as a potential mediator in these relationships. Thus, this research makes a significant contribution to the literature by shedding light on the strategic role of artificial intelligence as a potential mediator that translates marketing strategies into BS. Furthermore, this research has practical implications for business managers who aim to leverage artificial intelligence in their marketing and BS strategies to enhance the long-term competitiveness of their organizations. This study contributes to the existing literature in several ways. First, it integrates artificial intelligence, marketing strategies, and business sustainability within a unified empirical framework, providing a more comprehensive understanding of how digital technologies support organizational sustainability. Second, the study examines the mediating role of artificial intelligence in translating marketing strategies—specifically social media marketing and content marketing—into sustainable business outcomes. Third, the research provides empirical evidence from SMEs operating in an emerging economy context, thereby extending prior research on AI-driven marketing, which has predominantly focused on firms in developed economies.

## 2. Literature Review

The contemporary business environment is undergoing significant transition as Industry 4.0 technologies, particularly AI, become more deeply embedded in organizational processes [36,37]. This technological growth is influencing a wide range of industries and fields of practice [36]. Allowing brands for automated personalization, behavioral analysis, and accurate prediction of consumer needs [38]. Acknowledging that artificial intelligence is now a significant factor influencing digital marketing strategies is an ideal spot to start. Today, internet platforms play an important role in demonstrating and advertising firms' goods to particular consumers [38,39]. Despite being a relatively new scholarly topic, digital marketing has grown at a rapid rate and is already acknowledged as a central emphasis in contemporary marketing research [38,40]. As technological abilities advance, organizations rely more heavily on AI tools to improve their marketing processes and boost their competitive position in digital marketplaces.

### 2.1. Marketing Strategies and Business Sustainability

Marketing strategies play a crucial role in maintaining business success by enabling organizations to cope with changing markets, reinforce their competitive advantage, and attain sustainable business results [41,42]. Marketing-capable organizations are able to successfully utilize their resources and market understanding to create value for their customers through marketing strategies that are aligned with customer needs. Marketing capabilities also help organizations

successfully implement digital technologies without disrupting their strategic direction. The digital revolution has increased the strategic importance of marketing for organizations because they are increasingly utilizing digital marketing to engage with their customers and gain a competitive advantage [43]. Organizations use digital marketing strategies like social media marketing and content marketing to increase their visibility, enhance their customer relationships, and utilize their resources effectively. Empirical research has proved that organizations that adopt digital marketing innovations are able to attain sustainable business success through increased market penetration, conversion rates, and customer loyalty [44]. Marketing strategy can be best described as an ongoing and dynamic process that enables firms to achieve long-term goals [45]. Previous literature has shown that an effective marketing strategy has a positive impact on the performance and competitiveness of firms [46,47]. In this regard, the contribution of marketing strategies to organizational sustainability is direct through enhanced customer engagement and market position [48].

In recent years, AI applications such as chatbots, recommendation systems, predictive analytics, and automated content generation have become increasingly common in digital marketing. AI-powered chatbots enable companies to provide real-time customer support, streamline interactions, and enhance engagement by automating conversational responses and reducing response times [49]. Predictive analytics tools leverage machine learning to analyze large volumes of consumer data, anticipate future behaviors, and optimize marketing strategies for improved targeting and campaign performance [50]. Similarly, AI-driven recommendation systems personalize product or content suggestions based on individual preferences and browsing histories, improving customer experience and increasing conversion rates [51]. Additionally, advances in generative AI and automated content creation technologies are enabling firms to produce tailored marketing materials—such as social media posts and advertising copy—more efficiently and at scale, thereby supporting more dynamic and responsive digital marketing efforts [52]. These developments illustrate how a suite of AI applications is reshaping the scope and effectiveness of contemporary marketing strategies.

AI-enabled marketing strategies may also contribute to environmental sustainability. Digital marketing platforms supported by artificial intelligence enable organizations to design highly targeted campaigns, reducing reliance on traditional mass advertising methods such as printed promotional materials and physical marketing campaigns. By improving audience targeting and optimizing marketing communication, AI technologies can reduce unnecessary resource consumption and minimize marketing-related waste. Consequently, AI-supported digital marketing practices may indirectly support the environmental pillar of sustainability while enhancing marketing efficiency.

Today, social media marketing (SMM) is considered an integral part of the broader marketing strategies that impact communication, advertising, and customer relationship management [53,54]. For SMEs, especially in emerging economies, social media marketing is considered an important tool for enhancing competitiveness. Generally, social media acts as a platform for interactive communication that enables firms to engage customers through one-way promotion, two-way interaction, or a combination of both [55]. Previous literature has shown that an effective social media marketing strategy enhances customer engagement, relationships, and market position, which are important for sustainable business practices [44,56]. In this regard, social media adoption by SMEs has been shown to enhance brand recognition, customer trust, and long-term performance [44]

On the other hand, content marketing has developed as a new form of marketing strategy focused on the creation and dissemination of valuable, relevant, and consistent content for the purpose of attracting and retaining customers [57,58]. Unlike other forms of marketing characterized by disruptions from advertisements, content marketing focuses on the creation of meaningful information for the purpose of building relationships with consumers [59]. Empirical research indicates that content marketing improves brand trust, loyalty, and engagement while reducing consumer fatigue from advertisements [58]. To small and medium-sized enterprises (SMEs), digital content marketing acts as a powerful tool for sustainable growth since it helps businesses articulate

their value propositions and establish continuous interaction with customers [56,60]. Therefore, the following hypothesis can be developed:

**H1.** *There is a positive relationship between marketing strategies and business sustainability.*

**H1a.** *There is a positive relationship between social media marketing and business sustainability.*

**H1b.** *There is a positive relationship between content marketing and business sustainability.*

## 2.2. Marketing Strategies and Artificial Intelligence

AI is an integral component of modern marketing strategies, moving beyond mere automation and into decision-making and strategic planning [7]. Such technologies analyze large amounts of data to facilitate precise targeting, personalization, and optimal utilization [61] [62]. Programmatic advertising, predictive analytics, and automated content distribution are examples of how AI helps improve and increase the malleability of marketing strategies [63]. It helps businesses predict market trends and become more flexible in their strategies.

SMM is one of the most prominent forms of modern data-driven marketing strategies that provide businesses with enormous amounts of real-time user-generated data, including likes, shares, comments, click-through rates, and sentiments [61]. The management and analysis of such continuous and unstructured data make it impossible for businesses to rely on traditional analysis techniques, prompting them to seek better alternatives through AI technologies [64]. AI-based technologies and tools, including sentiment analysis, social listening, chatbots, and advertising optimization, enable businesses to effectively analyze and extract meaningful insights from social media interactions and become better positioned to address customer concerns and interests [65].

For small and medium-sized enterprises (SMEs), particularly in emerging economies, AI helps businesses make optimal utilization of social media platforms through efficient customer engagement and interaction [63,66]. According to prior research, businesses with higher social media engagement tend to make better utilization of AI-based analytics for precise targeting and better campaign performance [63]. Social media marketing is not only benefiting from AI technologies but also driving businesses toward embracing AI through its complex and dynamic nature.

CM is primarily concerned with the creation and distribution of valuable, pertinent, and consistent content to entice and retain customers in the long term. However, for this to be successful, it is vital to continually monitor performance, segment audiences, and optimize content on various digital platforms. To this end, AI plays a vital role in these processes by allowing for the creation of content, recommendations, predictions, and performance evaluation [4]. AI-assisted content tools help firms better communicate their messages, optimize the timing of content creation and distribution, and better understand consumer behavior and preferences. For small and medium-sized enterprises (SMEs) with limited resources, AI tools provide solutions to increase the effectiveness of content marketing while reducing costs [61,67]. According to empirical research, organizations that possess a strong orientation towards content marketing are more likely to use AI tools to address content complexity and make better strategic decisions [67,68]. Thus, content marketing creates a huge demand for AI tools, which further strengthens the connection between content marketing and artificial intelligence adoption. Based on this discussion, the following hypothesis is proposed:

**H2.** *There is a positive relationship between Marketing strategies and artificial intelligence.*

**H2a.** *There is a positive relationship between social media marketing and artificial intelligence.*

**H2b.** *There is a positive relationship between Content marketing and artificial intelligence.*

### 2.3. *The Mediating Role of Artificial Intelligence Between Marketing Strategies and Business Sustainability*

AI plays a vital mediating role in bridging the gap between marketing strategies and sustainable business performance. Artificial intelligence improves the efficiency of marketing strategies through automation, prediction, and customization of content, enabling businesses to achieve optimal utilization and minimize wastage[7]. Such efficiency is vital in creating sustainable business performance.

AI improves the relationship between strategic marketing and sustainable business through its ability to connect marketing strategies with data-driven insights [69]. AI-based marketing strategies do not only improve short-term performance but also contribute significantly to BS through its ability to ensure adaptability and resilience [7]. Although SMM and CM have been identified as vital contributors to BS, their success is largely dependent on businesses' ability to harness AI. AI acts as a mediating variable that bridges the gap between digital marketing and sustainable performance [4]. In SMM, AI contributes significantly to sustainable performance through its ability to analyze user-generated data, identify user behavior, and provide real-time responses [69]. AI-based SMM enables businesses to improve customer satisfaction and brand loyalty through optimal utilization of social media platforms and minimization of wastage. Such sustainable performance is vital in creating customer loyalty and improving business performance [70,71]. Without AI, social media marketing may not achieve optimal performance and sustainability due to information overload and inefficient decision-making.

In a similar vein, AI acts as a mediator for the content marketing and sustainability linkage by improving the content's relevance, consistency, and performance measurement. This improvement enables firms to create content that meets customers' interests and expectations. This improvement, in turn, promotes trust and the formation of long-term relationships with customers, which are key aspects of sustainability. In the context of SMEs, AI makes content marketing more cost-effective and easier to implement. This improvement, in turn, enhances the sustainability benefits of content marketing [61,72,73].

In aggregate, AI reinforces the content marketing and sustainability linkage by improving decision-making and automation. This improvement enables firms to achieve sustainability through social media and content marketing. In this regard, AI acts as a mediator that transforms social media and content marketing into sustainability. Based on the theoretical argument presented above, the following hypotheses are proposed:

**H3.** *Artificial intelligence mediates the relationship between marketing strategies and business sustainability.*

**H3a.** *Artificial intelligence mediates the relationship between social media marketing and business sustainability.*

**H3b.** *Artificial intelligence mediates the relationship between content marketing and business sustainability.*

### 2.4. *Artificial Intelligence and Business Sustainability*

AI plays a vital role in BS through its contributions to productivity, quality of decision-making, and innovation [74]. For instance, analytics enabled by AI help organizations to make predictions about consumer behavior and adapt to changes in the business environment.

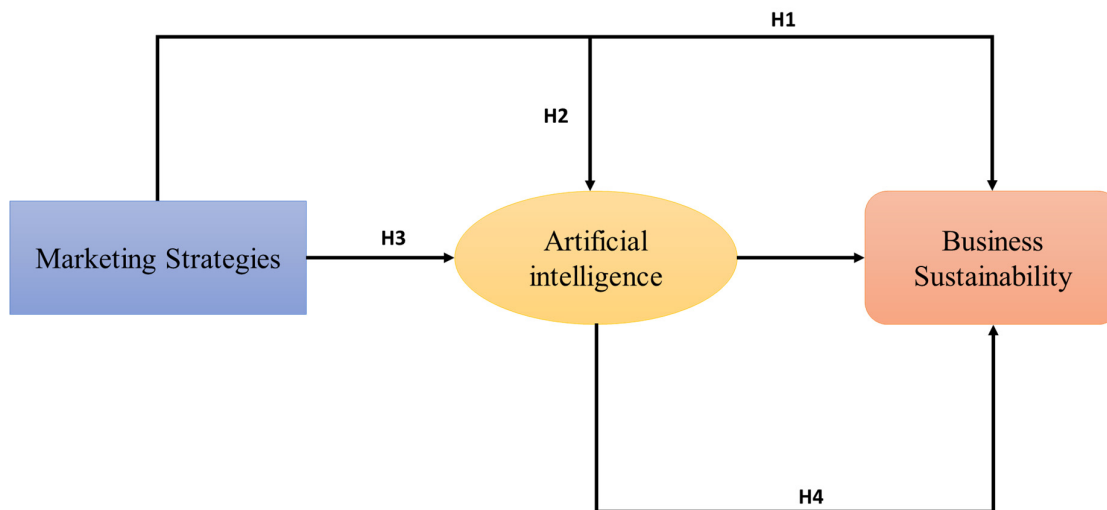

Empirical research has established that organizations that use AI to inform their marketing strategies exhibit better customer relationships, business risk management, and business strategy [75]. This makes AI a fundamental factor in BS. AI is increasingly playing a pivotal role in ensuring BS by enhancing business efficiency, quality of decision-making, and adaptability[74]. For instance, AI enables organizations to make better predictions about business environments through data analytics. This makes AI a fundamental factor in BS.

In the context of business strategy and marketing strategy, AI plays a vital role by enabling organizations to make better predictions about consumer behavior and business environments [75].

This makes AI a fundamental factor in BS. According to empirical research conducted on AI and BS, organizations that use AI to inform their business strategies exhibit better BS compared to those that do not use AI [75].

For small and medium-sized enterprises (SMEs), AI plays a vital role by helping to offset business constraints[74]. AI enables organizations to make better predictions about consumer behavior and business environments through analytics and data analysis. This makes AI a fundamental factor in BS. Based on the above theories and empirical research on AI and BS, the following hypothesis is proposed:

**H4.** *There is a positive relationship between Artificial intelligence and business sustainability.*

**Figure 1.** Conceptual Framework.

### 3. Methodology

The study aims to examine the role of AI in the mediation of MS and BS in the corporate environment of Nablus. The section provides an overview of the study design, population, sampling, data collection methods, and analysis.

#### 3.1. Study Design

The empirical design aims to test the proposed theoretical relationships using SPSS v 25, Process macro v 4.3 and AMOS v 24, allowing the study to provide empirical substantiation for the theoretical relationships between marketing strategies, artificial intelligence, and business sustainability. A survey was conducted to collect the required data from employees of different organizations in Nablus. The survey was conducted from June 2025 to August 2025. The study design was adopted for its ability to collect large amounts of data from a large population in a single study, thus allowing the testing of the relationships.

#### 3.2. Population and Sampling

The population of this study consists of employees working in small and medium-sized enterprises (SMEs) operating in the Nablus governorate. According to reports based on data from the Palestinian Central Bureau of Statistics (PCBS), Nablus hosts approximately 15,987 economic establishments, the majority of which are micro and small enterprises. SMEs are estimated to represent roughly 10% of these establishments, indicating that more than 1,500 SMEs operate in the governorate across sectors such as trade, services, and manufacturing. These enterprises play a central role in employment generation and local economic activity, making them an appropriate

context for examining the role of artificial intelligence in marketing strategies and business sustainability. In the Palestinian context, enterprises are commonly classified according to the number of employees, including micro enterprises (1–4 employees), small enterprises (5–19 employees), and medium enterprises (20–49 employees) [76–78]. SMEs therefore constitute a significant component of economic activity and employment in the region. The study employed a convenience sampling design. Convenience sampling was adopted for its ability to allow the study to collect large amounts of data from a diverse population of companies in the region. The study was able to collect the required information from employees of different levels in the companies, ranging from HR managers to operational managers. The study was limited in terms of the generalization of the findings. However, the study was appropriate for the purpose of the study since it aimed to collect information from employees working in the different companies in the region. The employees are the only people who have the necessary information about the marketing strategies of the companies. The minimum required sample size for this study was calculated using the widely applied sample size formula proposed by [79], which suggested an ideal sample size of 384 respondents for large populations. To ensure an adequate number of responses, 400 questionnaires were distributed to employees working in SMEs in the Nablus governorate. After the data collection process, 373 valid questionnaires were returned and retained for the final analysis, while the remaining questionnaires were excluded due to incomplete responses. The final sample therefore consisted of 373 respondents, representing a response rate of approximately 93%, which is considered acceptable for survey-based research.

### 3.3. Study Instruments

A questionnaire based on theoretical constructs and existing measurement data was used in the study. To measure the opinions of the study's participants on MS, AI, and BS, a five-point Likert scale ranging from 1, or "strongly disagree," to 5, or "strongly agree," was utilized. The middle value of the scale is neutral and balanced, which makes the results more accurate. The questionnaire was sent to the study's participants through direct and online methods, depending on their accessibility. Direct methods were used for bank personnel, who might not be easily reached through online means.

As mentioned in Table 1, the questionnaire asked the study's participants to provide information on five demographic variables, including gender, age, position, experience, and educational attainment. The sample size of the study consisted of 373 participants, mostly males, or 70.5%, while female participants accounted for 29.5%. According to the study, the majority of the participants, or 31.9%, were aged between 30-34, followed by 23.1%, or those aged 35-39, and 22%, or those aged 25-29. Only 6.2% were over 50 years old. According to the study, the majority, or 88.5%, of the study's participants held an undergraduate degree, while 11.5% held a postgraduate qualification. According to the study, the majority, or 34%, of the study's participants had 5-9 years of professional experience, followed by 24.4%, or those with 10-14 years, and 20.9%, or those with 1-4 years. Only a few participants had less than one year or more than 20 years of professional experience. According to the study, the majority, or 60.9%, of the study's participants were non-manager staff, followed by general managers, or 37%. According to the study, the majority, or 46.9%, of the study's participants came from the Marketing sector.

**Table 1.** Demographic characteristics of participants.

Gender			
		Frequency	Percent
Valid	Males	263	70.5
	Females	110	29.5
	Total	373	100.0
Age			
		Frequency	Percent
Valid	From 25–29	82	22.0

	From 30–34	119	31.9
	From 35–39	86	23.1
	From 40–44	35	9.4
	From 45–49	28	7.5
	More than 50s	23	6.2
	Total	373	100.0
<b>Educational Level</b>			
		Frequency	Percent
Valid	Undergraduate	330	88.5
	Postgraduate or above	43	11.5
	Total	373	100.0
<b>Years of Experience</b>			
		Frequency	Percent
Valid	Less than 1 year	1	0.3
	From 1–4 years	78	20.9
	From 5–9 years	127	34.0
	From 10–14 years	91	24.4
	From 15–19 years	39	10.5
	From 20–24 years	5	1.3
	25 or More years	32	8.6
	Total	373	100.0
<b>Position</b>			
		Frequency	Percent
Valid	Owner Manager	8	2.1
	General Manager	138	37.0
	Non-Managerial	227	60.9
	Total	373	100.0
<b>Industry</b>			
		Frequency	Percent
Valid	Travel & Hospitality	55	14.7
	Entertainment	24	6.4
	Technology	67	18.0
	Healthcare	23	6.2
	Finance	29	7.8
	Marketing	175	46.9
	Total	373	100.0

Cronbach's alpha values were 0.790 for the eight MS items created by [80] 0.855 for the seven items of SMM created by [80] , 0.752 for the six items of CM created by [80] , 0.931 for the seven items of AI created by [80], and 0.915 for the eight items of BS created by [81] . Cronbach's alpha for the 36 total components was 0.744. According to [82], for a study to be recognized as valid, its Cronbach's alpha needs to be at least 0.7. This demonstrates the reliability of every variable employed in this study.

### 3.4. Data Analysis Procedures

After completion of data collection, the responses were processed and prepared for analysis. Missing values were handled by mean imputation or excluded when applicable. Descriptive statistics were used for summarizing sample demographics and response distribution. Data analysis methods used for this study included SPSS v25 for descriptive statistics and initial correlations, AMOS v24 for confirmatory factor analysis (CFA) and SEM, and PROCESS macro v4.3 [83] for analyzing indirect effects in accordance with proposed mediation models. Before analyzing structural relationships, the

measurement model was tested for convergent validity, discriminant validity, and reliability. Evaluation was done based on factors like factor loadings, average variance extracted (AVE), and composite reliability (CR).

## 4. Results

### 4.1. Factor Analysis

It is possible to identify relationships between the measured variables and reduce their dimensionality using exploratory factor analysis (EFA) [84]. Factors were extracted using principal components analysis (PCA), and Promax rotation using Kaiser normalization was applied. As suggested in [82], only those items were retained that had loadings of at least 0.4 on one factor. Bartlett's Test of Sphericity was significant at  $P < 0.05$ , and the Kaiser-Meyer-Olkin measure was 0.788, which is sufficient for factor analysis[85].

Before analyzing the data, we checked for potential biases. Using Harman's single-factor test in SPSS v25 [86,87], an exploratory factor analysis of all measurement items showed that the first factor accounted for only 19.78% of the total variance, well below the 50% threshold, indicating that common method bias is unlikely to affect the results. Exploratory Factor Analysis (EFA) using Principal Component Analysis with Promax rotation identified five distinct factors, which together accounted for 65.85% of the total variance. The first factor explained 24.06% of the variance, followed by 12.94%, 11.17%, 9.79%, and 7.89% for Factors 2 to 5, respectively. All items loaded strongly on their respective constructs, with loading values ranging from .574 to .947. Items with low or cross-loadings were removed to ensure construct validity. The results of the exploratory factor analysis are shown in Table 2.

**Table 2.** Exploratory factor analysis results.

Item	Factor Loading	% of Variance Explained	Initial Eigenvalue	Cronbach's Alpha
<b>Factor 1: Business Sustainability (BS)</b>				
BS1	0.666	24.06%	6.978	0.915
BS2	0.813			
BS3	0.729			
BS4	0.761			
BS5	0.888			
BS6	0.803			
BS7	0.873			
BS8	0.794			
<b>Factor 2: Artificial Intelligence (AI)</b>				
AI1	0.906	12.94%	3.751	0.931
AI2	0.742			
AI3	0.882			
AI4	0.887			
AI5	0.752			
AI6	0.888			
AI7	0.769			
<b>Factor 3: Content Marketing (CM)</b>				
CM1	0.676	11.17%	3.24	0.752
CM2	0.639			
CM3	0.738			
CM4	0.69			

	CM5	0.574			
	CM6	0.685			
<b>Factor 4: Marketing Strategies (MS)</b>					
	MS1	0.771	9.79%	2.838	0.834
	MS3	0.847			
	MS4	0.786			
	MS7	0.839			
<b>Factor 5: Social Media Marketing (SMM)</b>					
	SMM3	0.904	7.89%	2.288	0.926
	SMM4	0.947			
	SMM6	0.841			
	SMM7	0.927			

#### 4.2. Confirmatory Factor Analysis

To validate the measurement set, confirmatory factor analysis was carried out to ensure the unidimensionality of the identified constructs. This was done by confirming the measurement set, which is a single latent dimension. The results were generated by utilizing AMOS software, version 24. Convergent validity was carried out to ensure the validity of the study. According to the literature, factor loadings can be used to test the convergent validity of the study, as suggested by [88] and [82]. Additionally, it is recommended by the same authors that the value of composite reliability should be 0.6 or higher, and the average variance extracted should be 0.5 or higher to ensure the validity of the study, as suggested by [88]. Table 3 shows the results obtained for the CFA, confirming the validity of the identified constructs, which are also reliable.

**Table 3.** Confirmatory factor analysis results.

Construct	Items	Factor Loading	CR	AVE
BS (Factor 1)	8	0.666–0.888	0.931	0.63
AI (Factor 2)	7	0.742–0.906	0.941	0.70
CM (Factor 3)	6	0.639–0.856	0.863	0.52
MS (Factor 4)	4	0.771–0.847	0.885	0.66
SMM (Factor 5)	4	0.841–0.947	0.948	0.82

Note: MS: Marketing Strategies, SMM: Social Media Marketing, CM: Content Marketing, AI: Artificial Intelligence, BS: Business Sustainability.

Furthermore, the study utilized the AMOS software, version 24, to test the model fitness, as demonstrated in Table 4, according to the standards set by [89]. There are six model fitness indicators, which are the Chi-square value divided by the number of freedom degrees, the comparative fitness index, the normed fitness index, the incremental fitness index, the root mean square error approximation, and the standardized root mean square residual. For this study, the value of CMIN/DF was 2.402, which is within the required benchmark, as suggested by [90]. Additionally, the CFI, the NFI, and the IFI were 0.954, 0.924, and 0.957, respectively, which is close to 0.9, according to the standards set by [91–93]. The value of the root means square error approximation was 0.059, while the value of the standardized root mean square residual was 0.072, which is within the benchmark requirements.

**Table 4.** Fit indicators for the CFA model.

Model	CMIN	DF	P	CMIN/DF	CFI	NFI	IFI	RMSEA	SRMR
	838.271	349	.000	2.402	0.954	0.924	0.957	0.059	0.072

To verify construct validity, the authors also performed a discriminant validity test. Statistical tests were created to determine whether the correlation between two constructs is statistically substantially smaller than unity to evaluate discriminant validity, according to [94]. The discriminant validity test is summarized in Table 5.

**Table 5.** The discriminant validity test.

	MS	SMM	CM	AI	BS
MS	<b>0.911</b>	.906**	.763**	.676**	.568**
SMM	.906**	<b>0.908</b>	.645**	.634**	.506**
CM	.763**	.645**	<b>0.869</b>	.762**	.810**
AI	.676**	.634**	.762**	<b>0.835</b>	.767**
BS	.568**	.506**	.810**	.767**	<b>0.893</b>

\*\* . Correlation is significant at the 0.01 level (2-tailed). Note: MS: Marketing Strategies, SMM: Social Media Marketing, CM: Content Marketing, AI: Artificial Intelligence, BS: Business Sustainability.

#### 4.3. Hypothesis Testing

Table 6 presents the results of the hypothesis testing carried out in this study. The findings show that MS had a significant positive effect on BS (H1:  $R^2 = 0.323$ ,  $F = 177.008$ ,  $p = .000$ ,  $\beta = 0.387$ ). Social Media Marketing (SMM) also significantly contributed to BS (H1a:  $R^2 = 0.256$ ,  $F = 127.567$ ,  $p = .000$ ,  $\beta = 0.206$ ), while Content Marketing (CM) exhibited a particularly strong influence (H1b:  $R^2 = 0.656$ ,  $F = 706.212$ ,  $p = .000$ ,  $\beta = 0.953$ ). In addition, MS showed a significant impact on Artificial Intelligence (AI) (H2:  $R^2 = 0.457$ ,  $F = 312.299$ ,  $p = .000$ ,  $\beta = 0.305$ ), with both SMM (H2a:  $R^2 = 0.402$ ,  $F = 249.206$ ,  $p = .000$ ,  $\beta = 0.171$ ) and CM (H2b:  $R^2 = 0.580$ ,  $F = 512.358$ ,  $p = .000$ ,  $\beta = 0.593$ ) also demonstrating significant effects on AI. The mediation results further revealed that MS positively influenced BS through AI (H3:  $R^2 = 0.5928$ ,  $F = 269.295$ ,  $p = .000$ ,  $\beta = 1.066$ ), with similar indirect effects observed for both SMM (H3a:  $R^2 = 0.5888$ ,  $F = 264.944$ ,  $p = .000$ ,  $\beta = 1.128$ ) and CM (H3b:  $R^2 = 0.7094$ ,  $F = 451.565$ ,  $p = .000$ ,  $\beta = 0.5411$ ). Additionally, AI itself had a strong and significant direct effect on BS (H4:  $R^2 = 0.588$ ,  $F = 529.923$ ,  $p = .000$ ,  $\beta = 1.160$ ). Overall, these findings support all proposed hypotheses, highlighting robust predictive relationships among MS, SMM, CM, AI, and BS in line with the criteria specified in [95].

**Table 6.** Results of hypothesis testing.

	Linkage	$R^2$	F Test	P-value	B Coefficient	Hypothesis Acceptance
H <sub>1</sub>	MS—BS	0.323	177.008	.000	0.387	Accepted
H <sub>1a</sub>	SMM—BS	0.256	127.567	.000	0.206	Accepted
H <sub>1b</sub>	CM—BS	0.656	706.212	.000	0.953	Accepted
H <sub>2</sub>	MS—AI	0.457	312.299	.000	0.305	Accepted
H <sub>2a</sub>	SMM—AI	0.402	249.206	.000	0.171	Accepted
H <sub>2b</sub>	CM—AI	0.580	512.358	.000	0.593	Accepted
H <sub>3</sub>	MS—AI—BS	0.5928	269.295	.000	1.066	Accepted
H <sub>3a</sub>	SMM—AI—BS	0.5888	264.944	.000	1.128	Accepted

Note: MS: Marketing Strategies, SMM: Social Media Marketing, CM: Content Marketing, AI: Artificial Intelligence, BS: Business Sustainability.

## 4. Discussion

The current study provides robust empirical evidence on the close and significant association between marketing strategies, specifically content marketing and social media marketing, and BS in

SMEs in Nablus, Palestine, directly and indirectly through AI. What is more interesting in this study is not only to verify these relationships but also to identify differences in these relationships between different marketing strategies in terms of their contribution to BS.

The established relationship between marketing strategies and BS supports the strategic marketing theory, which argues that marketing capabilities are considered one of the key intangible resources in enhancing BS. Marketing strategies in SMEs, where financial and technological resources are scarce, are considered to contribute to BS by providing stability in terms of customer relationships and competitive advantage. This argument was also presented by previous studies [96] who argued that marketing capabilities are key drivers in managing uncertainty and enhancing BS in contemporary business environments. Beyond economic performance, AI-enabled marketing strategies may also contribute to environmental sustainability by reducing reliance on printed promotional materials and enabling more efficient digital communication with target audiences.

The current study contributes to marketing theory by differentiating between the effects of social media marketing and content marketing on BS. Although social media marketing was found to have a positive and significant effect on BS, it was found to have a weaker effect in comparison to content marketing. This may indicate that social media marketing may not be effective in creating sustainability in business environments. This finding is consistent with previous research by [97] that suggest social media marketing plays a good role in increasing customers engagement and support short term business performance. This argument may not be in line with marketing theories and empirical evidence on social media marketing, which considered it to be one of the key drivers of BS.[98]

On the other hand, content marketing was revealed to be the most viable predictor of BS. This reveals that small and medium-sized enterprises (SMEs) in Nablus place greater strategic importance on credibility, information quality, and trust creation than on promotional activities per se. Content marketing is a strategy that enables firms to educate consumers and eliminate uncertainty to establish authority in the respective markets. This strategy is more viable in environments where consumer trust is extremely significant to BS. This research substantiates the research by [43] and further builds on it by revealing that the sustainability impact of content marketing is strategic in nature rather than being merely operational.

AI plays a pivotal role in reinforcing these relationships. The research reveals that AI maintains a direct relationship with BS and significantly mediates the relationships between marketing strategies and sustainability outcomes. This reveals that marketing strategies are significantly more viable when reinforced by AI tools such as data analytics, automation, personalization, etc. However, it is also revealed that AI does not replace human decision-making but rather makes these strategies more viable by making them more accurate and responsive to customer needs while being more efficient in terms of resource utilization. And this finding is consistent with previous research which discuss same idea that AI help to improve marketing effectiveness through automation, personalization.[7]

However, it is also revealed that AI mediates the relationship between content marketing and sustainability more significantly than its mediation of the relationship between social media marketing and sustainability outcomes. This may be attributed to the fact that AI is more structurally compatible with content marketing than social media marketing. AI is more viable in terms of personalization of content to increase customer value over time. However, social media marketing is often controlled by external forces such as social media algorithms and is less viable for AI optimization to produce viable sustainability outcomes.

From a conceptual point of view, this research mainly views BS as economic sustainability, which is associated with the ability of businesses to sustain performance and continuity. Although social and environmental sustainability were not considered in this research, businesses that achieve economic sustainability have higher chances of investing in social and environmental issues in the future. This is important in avoiding overstatement and creating a solid foundation for future research on ESG. This idea is align with previous Recent literature suggests that achieving economic

strength allows firms not only to maintain performance but also to allocate resources toward long-term ESG commitments and build resilience in changing environments[99]

From the results, it is clear that sustainability in SMEs in emerging economies is not achieved through technology adoption but through strategic integration with high-value marketing strategies using AI. Businesses that integrate technology with customer-oriented and content-rich strategies have higher chances of sustaining their competitive advantage and BS. Although all the hypothesized relationships were statistically supported, it is possible that the extent of these effects may vary across industries and digital maturity, suggesting that AI-based marketing does not ensure sustainability as this align with previous studies [100]

### 5.1. Theoretical implication

This research has a number of theoretical implications for the digital marketing, AI, and BS literatures. First, the current research contributes to the theoretical development of these fields by validating a unified conceptual model of marketing strategies, social media marketing, content marketing, and AI, and by exploring these constructs simultaneously. This is particularly relevant in response to recent calls for the development of more integrative models of digital marketing and technology, which can account for the combined and interactive effects of these constructs on BS. The study responds to growing suggestions in the literature that digital marketing research should adopt more interdisciplinary and holistic approaches [16]

The current research also contributes to the theoretical development of the marketing and technology adoption literatures by revealing the mediating role of AI in enhancing the sustainability benefits of marketing strategies. The study makes a significant theoretical contribution by showing that, rather than being merely a technological device that marketers use, artificial intelligence (AI) actually serves a strategic mediating function that increases the overall value of marketing activities. The research found that, indeed, the value of AI stems from its association with significant marketing activities, with content marketing being a key mediator, thereby supporting technology adoption theory and technology value creation theory.

The research also makes a significant contribution to the burgeoning research on digital economies by exploring the role of AI within the Palestinian context, a context that has been somewhat neglected within digital marketing and AI research. The research found that, even within a resource-constrained environment, AI could play a pivotal role in enhancing the overall value of marketing strategies, providing sustainability, and extending the external validity of existing theory, which has been developed and tested within a developed economy context.

### 5.2. Practical Implications

From a practical perspective, the research provides several explicit implications that could help organizations enhance long-run sustainability, particularly within a digital marketing context. The results suggest that, rather than focusing on raising the overall level of marketing activity, organizations could enhance sustainability by focusing on content marketing, particularly by providing high-quality content that has real value to consumers. This is consistent with earlier studies showing that high-quality and meaningful content helps build customer engagement, fosters trust, and supports long-term relationships with customers [101]

Furthermore, the importance of AI also points to the importance of including AI-based solutions in marketing strategies. Organizations can capitalize on this in various ways to improve the efficiency and effectiveness of their marketing strategies, which is particularly important for small and medium-sized enterprises (SMEs) in Nablus, considering their financial and operational constraints in managing their scarce resources. By employing various marketing strategies that include AI-based solutions, SMEs in Nablus would be able to improve the efficiency and effectiveness of their marketing strategies, hence increasing their sustainability.

## 5.2. Managerial Implications

The results also have various implications for managers and decision-makers. Managers should ensure that they align their marketing strategies with other digital marketing and digital transformation strategies. Sustainability is achieved through successful integration and not through successful strategies. Managers should also ensure that they promote interdepartmental collaboration and interaction among various departments, including the marketing, information technology, and data analytics departments, to realize the full potential of various marketing strategies that include AI-based solutions.

Managers should also invest in human capital and promote an organizational culture that is innovative and supports experimentation and implementation of various marketing strategies that include AI-based solutions.

Managers, particularly those in SMEs in Nablus, are encouraged to invest in appropriate technological infrastructure. Customer relationship management systems are necessary to incorporate marketing strategies incorporating AI solutions. Technological infrastructure is the foundation on which to base digital marketing strategies to ensure long-run viability and competitive advantage. These recommendations are consistent with prior research on digital transformation, which highlights that successfully leveraging digital technologies depends on aligning strategies, developing organizational capabilities, and promoting collaboration across different functions [102]

## 6. Conclusions

The aim of this study was to examine the relationships between marketing strategies—including social media marketing and content marketing—and BS, with AI acting as a mediator. The findings indicate that marketing strategies are positively associated with BS, highlighting the relevance of digital marketing approaches for enhancing sustainable business performance in organizations. Among the strategies considered, content marketing emerged as the most influential factor associated with BS, suggesting that organizations seeking sustainable outcomes may benefit from prioritizing content-driven marketing initiatives.

The study also finds that AI plays a supportive mediating role in the relationship between marketing strategies and BS. Specifically, the strategic integration of AI can enhance the effectiveness of marketing strategies, improve decision-making, and ultimately strengthen sustainability outcomes. These results contribute to the literature by emphasizing the significance of AI in marketing practices, particularly within the context of SMEs in the emerging economy of Nablus.

From a practical standpoint, SMEs can leverage AI-driven marketing strategies to maximize their sustainability impact. By aligning content and social media marketing efforts with AI technologies, firms may achieve greater efficiency, effectiveness, and long-term sustainable performance.

## 7. Limitations and Future Studies

Despite its contributions, this study has several limitations that warrant consideration. First, the research focuses exclusively on SMEs in Nablus, providing valuable context-specific insights but potentially limiting the generalizability of findings to other regions, cities, or countries with different economic, technological, or AI adoption environments. Future research should test the robustness of these findings across diverse contexts. Second, the study employs a cross-sectional design, with data collected at a single point in time, which constrains understanding of the dynamic effects of AI adoption and marketing strategies on business sustainability (BS). Longitudinal studies are recommended to capture these relationships over time, particularly in rapidly evolving technological environments. Third, this research primarily examines the economic dimension of BS; future studies could extend this focus to environmental and social sustainability outcomes, including their integration within corporate governance frameworks, to provide a more comprehensive understanding of sustainable business practices. Fourth, the study relies on self-reported survey data,

which may introduce perceptual bias, social desirability effects, and potential overestimation of AI's effectiveness. To mitigate these limitations, future research should incorporate multi-source and objective measures, such as financial performance indicators, operational metrics, and managerial or customer perspectives, to validate survey findings and enhance the rigor and reliability of the results. Finally, while the study considers AI broadly, it does not differentiate among specific AI applications (e.g., predictive analytics, chatbots, automated content generation), which may have varying effects on marketing strategies and BS. Future research is encouraged to investigate which AI tools are most prevalent and effective in enhancing sustainable business performance. Addressing these limitations, including exploring environmental and social dimensions of BS and the governance context, will strengthen the evidence on the interplay between AI, marketing strategies, and BS, and provide more actionable insights for SMEs navigating digital transformation in emerging economies.

**Author Contributions:** Conceptualization, O.M. and L.T.; methodology, O.M. and L.T.; data collection, O.M.; analysis, O.M. and L.T.; writing—original draft preparation, O.M.; writing—review and editing, O.M. and L.T.; supervision, L.T. All authors have read and agreed to the published version of the manuscript.

**Funding:** This study the impact of AI on marketing strategies and business sustainability received no external funding.

**Institutional Review Board Statement:** This study the impact of AI on marketing strategies and business sustainability was conducted in accordance with the Declaration of Helsinki and approved by the ethics committee of Near East University (NEU/SS/2025/2024).

**Informed Consent Statement:** Informed consent was obtained from all subjects involved in the study.

**Data Availability Statement:** The original contributions presented in the study are included in the article; further inquiries can be directed to the corresponding author.

**Acknowledgments:** This work is based on the first author's doctoral dissertation, titled "The impact of AI on Marketing strategies and business sustainability" The planned submission date is June 2026. The dissertation supervisor is the second author of this work.
