IDENTITIES OF THE CHEBYSHEV POLYNOMIALS, THE INVERSE OF A TRIANGULAR MATRIX, AND IDENTITIES OF THE CATALAN NUMBERS

FENG QI AND BAI-NI GUO

Abstract. In the paper, the authors establish two identities to express the generating function of the Chebyshev polynomials of the second kind and its higher order derivatives in terms of the generating function and its derivatives each other, deduce an explicit formula and an identities for the Chebyshev polynomials of the second kind, derive the inverse of an integer, unit, and lower triangular matrix, present several identities of the Catalan numbers, and give some remarks on the closely related results including connections of the Catalan numbers respectively with the Chebyshev polynomials, the central Delannoy numbers, and the Fibonacci polynomials.

1. Preliminaries

It is common knowledge [8, 15, 52] that the generalized hypergeometric series

$$ {}_pF_q(a_1,\dots,a_p;b_1,\dots,b_q;z)=\sum_{n=0}^\infty\frac{(a_1)_n\cdots(a_p)_n}{(b_1)_n\cdots(b_q)_n}\frac{z^n}{n!} $$

is defined for complex numbers $a_i\in\mathbb{C}$ and $b_i\in\mathbb{C}\setminus\{0,-1,-2,\dots\}$, for positive integers $p,q\in\mathbb{N}$, and in terms of the rising factorials $(x)_n$ defined by

$$ (x)_n=\prod_{\ell=0}^{n-1}(x+\ell)=\begin{cases}x(x+1)\cdots(x+n-1), & n\ge1;\\ 1, & n=0.\end{cases} $$

Specially, one calls ${}_2F_1(a,b;c;z)$ the classical hypergeometric function.

It is well known [12, 47, 55] that the Catalan numbers C_n for $n\ge0$ form a sequence of natural numbers that occur in tree enumeration problems such as "In how many ways can a regular n-gon be divided into $n-2$ triangles if different orientations are counted separately? whose solution is the Catalan number C_{n-2}". The Catalan numbers C_n can be generated by

$$ \frac{2}{1+\sqrt{1-4x}}=\frac{1-\sqrt{1-4x}}{2x}=\sum_{n=0}^\infty C_nx^n=1+x+2x^2+5x^3+\cdots $$

and explicitly expressed as

$$ C_n=\frac{1}{n+1}\binom{2n}{n}={}_2F_1(1-n,-n;2;1)=\frac{4^n\Gamma(n+1/2)}{\sqrt{\pi}\,\Gamma(n+2)}, $$

 doi:10.20944/preprints201703.0209.v1

where the classical Euler gamma function can be defined [8, 15, 24, 30, 52] by

$$\Gamma(z)=\int_0^\infty t^{z-1}e^{-t}\,\mathrm{d}\,t, \quad \Re(z)>0$$

or by

$$\Gamma(z)=\lim_{n\to\infty}\frac{n!n^z}{\prod_{k=0}^n(z+k)}, \quad z\in\mathbb{C}\setminus\{0,-1,-2,\dots\}.$$

For more information on the Catalan numbers C_k and their recent developments, please refer to the monographs [2, 12, 55], the papers [13, 25, 34, 40, 46, 47, 54, 59, 61, 62, 63] and the closely related references therein.

The first six Chebyshev polynomials of the second kind $U_k(x)$ for $0\le k\le 5$ are

$$U_0(x)=1, \quad U_1(x)=2x, \quad U_2(x)=4x^2-1, \quad U_3(x)=8x^3-4x,$$
$$U_4(x)=16x^4-12x^2+1, \quad U_5(x)=32x^5-32x^3+6x.$$

They can be generated by

$$F(t)=F(t,x)=\frac{1}{1-2xt+t^2}=\sum_{n=0}^\infty U_n(x)t^n$$

for $|x|<1$ and $|t|<1$. For more information on the Chebyshev polynomials of the second kind $U_k(x)$, please refer to [28, Section 7], the monographs [8, 15, 52] and the closely related references therein.

Let $\lfloor x\rfloor$ denote the floor function whose value is the largest integer less than or equal to x and let $\lceil x\rceil$ stand for the ceiling function which gives the smallest integer not less than x. When $n\in\mathbb{Z}$, it is easy to see that

$$\left\lfloor\frac{n}{2}\right\rfloor=\frac{1}{2}\left[n-\frac{1-(-1)^n}{2}\right] \quad \text{and} \quad \left\lceil\frac{n}{2}\right\rceil=\frac{1}{2}\left[n+\frac{1-(-1)^n}{2}\right].$$

In this paper, we will establish two identities to express the generating function $F(t)$ of the Chebyshev polynomials of the second kind $U_k(x)$ and its higher order derivatives $F^{(k)}(t)$ in terms of $F(t)$ and $F^{(k)}(t)$ each other, deduce an explicit formula and an identities for the Chebyshev polynomials of the second kind $U_k(x)$, derive the inverse of an integer, unit, and lower triangular matrix, present several identities of the Catalan numbers C_k, and give some remarks on the closely related results including connections of the Catalan numbers C_k respectively with the Chebyshev polynomials $U_k(x)$, the central Delannoy numbers, and the Fibonacci polynomials.

2. Lemmas

In order to prove our main results, we recall several lemmas below.

Lemma 2.1 ([2, p. 134, Theorem A] and [2, p. 139, Theorem C])**.** *For $n\ge k\ge 0$, the Bell polynomials of the second kind, denoted by $\mathrm{B}_{n,k}(x_1,x_2,\dots,x_{n-k+1})$, are defined by*

$$\mathrm{B}_{n,k}(x_1,x_2,\dots,x_{n-k+1})=\sum_{\substack{1\le i\le n,\ell_i\in\{0\}\cup\mathbb{N}\\ \sum_{i=1}^n i\ell_i=n\\ \sum_{i=1}^n \ell_i=k}}\frac{n!}{\prod_{i=1}^{n-k+1}\ell_i!}\prod_{i=1}^{n-k+1}\left(\frac{x_i}{i!}\right)^{\ell_i}.$$

Preprints (www.preprints.org) | NOT PEER-REVIEWED | Posted: 28 March 2017 doi:10.20944/preprints201703.0209.v1

The Faà di Bruno formula can be described in terms of the Bell polynomials of the second kind $\mathrm{B}_{n,k}(x_1,x_2,\dots,x_{n-k+1})$ *by*

$$\frac{\mathrm{d}^n}{\mathrm{d}\,t^n} f\circ h(t)=\sum_{k=1}^{n} f^{(k)}(h(t))\mathrm{B}_{n,k}\big(h'(t),h''(t),\dots,h^{(n-k+1)}(t)\big), \quad n\in\mathbb{N}. \tag{2.1}$$

Lemma 2.2 ([2, p. 135])**.** *For complex numbers a and b, we have*

$$\mathrm{B}_{n,k}\big(abx_1,ab^2x_2,\dots,ab^{n-k+1}x_{n-k+1}\big)=a^kb^n\mathrm{B}_{n,k}(x_1,x_2,\dots,x_{n-k+1}). \tag{2.2}$$

Lemma 2.3 ([9, Theorem 4.1], [45, Eq. (2.8)], and [56, Lemma 2.5])**.** *For $0\le k\le n$, the Bell polynomials of the second kind $\mathrm{B}_{n,k}$ satisfy*

$$\mathrm{B}_{n,k}(x,1,0,\dots,0)=\frac{1}{2^{n-k}}\frac{n!}{k!}\binom{k}{n-k}x^{2k-n}, \tag{2.3}$$

where $\binom{p}{q}=0$ for $q>p\ge0$.

Lemma 2.4 ([7] and [12, pp. 112–114])**.** *Let $T(r,1)=1$ and*

$$T(r,c)=\sum_{i=c-1}^{r} T(i,c-1), \quad c\ge2,$$

or, equivalently,

$$T(r,c)=\sum_{j=1}^{c} T(r-1,j), \quad r,c\in\mathbb{N}.$$

Then

$$T(r,c)=\frac{r-c+2}{r+1}\binom{r+c-1}{r}, \quad r,c\in\mathbb{N}$$

and $T(n,n)=C_n$ for $n\in\mathbb{N}$.

Lemma 2.5 ([16, p. 2, Eq. (10)] and [3])**.** *For $n\in\mathbb{N}$, the Catalan numbers C_n have the integral representation*

$$C_n=\frac{1}{2\pi}\int_0^4\sqrt{\frac{4-x}{x}}\,x^n\,\mathrm{d}\,x. \tag{2.4}$$

Lemma 2.6. *For $t\ne0$ and $j\in\mathbb{N}$, we have*

$${}_2F_1\left(\frac{1-j}{2},\frac{2-j}{2};1-j;\frac{1}{t^2}\right)=\frac{1}{2^j}\frac{t}{\sqrt{t^2-1}}\left[\left(1+\frac{\sqrt{t^2-1}}{t}\right)^j-\left(1-\frac{\sqrt{t^2-1}}{t}\right)^j\right]. \tag{2.5}$$

Proof. In [8, pp. 999–1000], it was listed that

$$G_n^\lambda(t)=\frac{1}{\sqrt{\pi}}\frac{\Gamma(2\lambda+n)}{n!\Gamma(2\lambda)}\frac{\Gamma\big(\frac{2\lambda+1}{2}\big)}{\Gamma(\lambda)}\int_0^\pi\Big(t+\sqrt{t^2-1}\,\cos\phi\Big)^n\sin^{2\lambda-1}\phi\,\mathrm{d}\,\phi \tag{2.6}$$

and

$$G_n^\lambda(t)=\frac{2^n\Gamma(\lambda+n)}{n!\Gamma(\lambda)}t^n{}_2F_1\left(-\frac{n}{2},\frac{1-n}{2};1-\lambda-n;\frac{1}{t^2}\right), \tag{2.7}$$

where $G_n^\lambda(t)$ stands for the Gegenbauer polynomials which are the coefficients of α^n in the power-series expansion

$$\frac{1}{(1-2t\alpha+\alpha^2)^\lambda}=\sum_{k=0}^{\infty}G_k^\lambda(t)\alpha^n.$$

Preprints (www.preprints.org) | NOT PEER-REVIEWED | Posted: 28 March 2017 doi:10.20944/preprints201703.0209.v1

Taking $n=j-1$ and $\lambda=1$ in equalities (2.6) and (2.7), combining them, and simplifying give

$$\begin{aligned}
{}_2F_1\biggl(\frac{1-j}{2},\frac{2-j}{2};1-j;\frac{1}{t^2}\biggr)&=\frac{j}{2^j}\frac{1}{t^{j-1}}\int_0^\pi\Bigl(t+\sqrt{t^2-1}\,\cos\phi\Bigr)^{j-1}\sin\phi\operatorname{d}\phi\\
&=\frac{j}{2^j}\frac{(t^2-1)^{(j-1)/2}}{t^{j-1}}\int_0^\pi\biggl(\frac{t}{\sqrt{t^2-1}}+\cos\phi\biggr)^{j-1}\sin\phi\operatorname{d}\phi\\
&=\frac{j}{2^j}\frac{(t^2-1)^{(j-1)/2}}{t^{j-1}}\int_0^\pi\sum_{\ell=0}^{j-1}\binom{j-1}{\ell}\biggl(\frac{t}{\sqrt{t^2-1}}\biggr)^{j-1-\ell}\cos^\ell\phi\sin\phi\operatorname{d}\phi\\
&=\frac{j}{2^j}\frac{(t^2-1)^{(j-1)/2}}{t^{j-1}}\sum_{\ell=0}^{j-1}\binom{j-1}{\ell}\biggl(\frac{t}{\sqrt{t^2-1}}\biggr)^{j-1-\ell}\int_0^\pi\cos^\ell\phi\sin\phi\operatorname{d}\phi\\
&=\frac{j}{2^j}\frac{(t^2-1)^{(j-1)/2}}{t^{j-1}}\biggl(\frac{t}{\sqrt{t^2-1}}\biggr)^{j-1}\sum_{\ell=0}^{j-1}\binom{j-1}{\ell}\biggl(\frac{\sqrt{t^2-1}}{t}\biggr)^{\ell}\frac{(-1)^\ell+1}{\ell+1}\\
&=\frac{j}{2^j}\sum_{\ell=0}^{j-1}\binom{j-1}{\ell}\biggl(\frac{\sqrt{t^2-1}}{t}\biggr)^{\ell}\frac{(-1)^\ell+1}{\ell+1}\\
&=\frac{1}{2^j}\frac{t}{\sqrt{t^2-1}}\biggl[\biggl(1+\frac{\sqrt{t^2-1}}{t}\biggr)^j-\biggl(1-\frac{\sqrt{t^2-1}}{t}\biggr)^j\biggr].
\end{aligned}$$

The formula (2.5) is thus proved. The proof of Lemma 2.5 is complete. □

Lemma 2.7 ([8, p. 399])**.** *If $\Re(\nu)>0$, then*

$$\int_0^{\pi/2}\cos^{\nu-1}x\cos(ax)\operatorname{d}x=\frac{\pi}{2^\nu\nu B\bigl(\frac{\nu+a+1}{2},\frac{\nu-a+1}{2}\bigr)},\tag{2.8}$$

where $B(\alpha,\beta)$ stands for the classical beta function satisfying

$$B(\alpha,\beta)=\frac{\Gamma(\alpha)\Gamma(\beta)}{\Gamma(\alpha+\beta)}=B(\beta,\alpha),\quad \Re(\alpha),\Re(\beta)>0.$$

3. Identities of the Chebyshev polynomials of the second kind

In this section, we establish three identities and an explicit formula for the Chebyshev polynomials of the second kind $U_k(x)$, their generating function $F(t)$, and higher order derivatives $F^{(k)}(t)$. Why do we start our research in this paper from here? Please read Remark 6.1 in Section 6 below.

Theorem 3.1. *For $n\in\mathbb{N}$, the nth derivatives of the generating function $F(t)$ of the Chebyshev polynomials of the second kind $U_k(x)$ satisfy*

$$F^{(n)}(t)=\frac{n!}{[2(t-x)]^n}\sum_{k=\lceil n/2\rceil}^n(-1)^k\binom{k}{n-k}[2(t-x)]^{2k}F^{k+1}(t)\tag{3.1}$$

and

$$F^{n+1}(t)=\frac{1}{n}\frac{1}{[2(t-x)]^{2n}}\sum_{k=1}^n\frac{(-1)^k}{(k-1)!}\binom{2n-k-1}{n-1}[2(t-x)]^kF^{(k)}(t).\tag{3.2}$$

Preprints (www.preprints.org) | NOT PEER-REVIEWED | Posted: 28 March 2017 doi:10.20944/preprints201703.0209.v1

Consequently, the Chebyshev polynomials of the second kind $U_n(x)$ satisfy

$$U_n(x) = \frac{(-1)^n}{(2x)^n} \sum_{k=\lceil n/2 \rceil}^{n} (-1)^k \binom{k}{n-k} (2x)^{2k} \tag{3.3}$$

and

$$\sum_{k=1}^{n} k \binom{2n-k-1}{n-1} (2x)^k U_k(x) = n(2x)^{2n}. \tag{3.4}$$

Proof. By the formulas (2.1), (2.2), and (2.3) in sequence, we have

$$\begin{aligned}
F^{(n)}(t) &= \frac{\mathrm{d}^n}{\mathrm{d}\, t^n}\left(\frac{1}{1-2tx+t^2}\right) \\
&= \sum_{k=1}^{n} \left(\frac{1}{u}\right)^{(k)} \mathrm{B}_{n,k}(-2x+2t, 2, 0, \dots, 0) \\
&= \sum_{k=1}^{n} \frac{(-1)^k k!}{u^{k+1}} 2^k \mathrm{B}_{n,k}(t-x, 1, 0, \dots, 0) \\
&= \sum_{k=1}^{n} \frac{(-1)^k k!}{u^{k+1}} 2^k \frac{1}{2^{n-k}} \frac{n!}{k!} \binom{k}{n-k} (t-x)^{2k-n} \\
&= (-1)^n n! \sum_{k=1}^{n} (-1)^k 2^{2k-n} \binom{k}{n-k} \frac{(x-t)^{2k-n}}{(1-2tx+t^2)^{k+1}} \\
&= (-1)^n n! \sum_{k=1}^{n} (-1)^k 2^{2k-n} \binom{k}{n-k} (x-t)^{2k-n} F^{k+1}(t)
\end{aligned}$$

for $n \in \mathbb{N}$, where $u = u(t,x) = 1 - 2tx + t^2$. This can be rewritten as the formula (3.1).

We can reformulate the formula (3.1) as

$$\begin{pmatrix}
\frac{[2(t-x)]^1}{1!} F'(t) \\
\frac{[2(t-x)]^2}{2!} F''(t) \\
\frac{[2(t-x)]^3}{3!} F^{(3)}(t) \\
\vdots \\
\frac{[2(t-x)]^{n-2}}{(n-2)!} F^{(n-2)}(t) \\
\frac{[2(t-x)]^{n-1}}{(n-1)!} F^{(n-1)}(t) \\
\frac{[2(t-x)]^{n}}{n!} F^{(n)}(t)
\end{pmatrix}
= A_n
\begin{pmatrix}
(-1)^1 [2(x-t)]^2 F^2(t) \\
(-1)^2 [2(x-t)]^4 F^3(t) \\
(-1)^3 [2(x-t)]^6 F^4(t) \\
\vdots \\
(-1)^{n-2} [2(x-t)]^{2(n-2)} F^{n-1}(t) \\
(-1)^{n-1} [2(x-t)]^{2(n-1)} F^{n}(t) \\
(-1)^{n} [2(x-t)]^{2n} F^{n+1}(t)
\end{pmatrix}$$

for $n \in \mathbb{N}$, where $A_n = (a_{i,j})_{n \times n}$ with

$$a_{i,j} = \begin{cases} 0, & i < j \\ \binom{j}{i-j}, & j \le i \le 2j \\ 0, & i > 2j \end{cases}$$

Preprints (www.preprints.org) | NOT PEER-REVIEWED | Posted: 28 March 2017 doi:10.20944/preprints201703.0209.v1

for $i,j\in\mathbb{N}$. This means that

$$\begin{pmatrix}(-1)^1[2(x-t)]^2F^2(t)\\(-1)^2[2(x-t)]^4F^3(t)\\(-1)^3[2(x-t)]^6F^4(t)\\\vdots\\(-1)^{n-2}[2(x-t)]^{2(n-2)}F^{n-1}(t)\\(-1)^{n-1}[2(x-t)]^{2(n-1)}F^{n}(t)\\(-1)^{n}[2(x-t)]^{2n}F^{n+1}(t)\end{pmatrix}=A_n^{-1}\begin{pmatrix}\frac{[2(t-x)]^1}{1!}F'(t)\\\frac{[2(t-x)]^2}{2!}F''(t)\\\frac{[2(t-x)]^3}{3!}F^{(3)}(t)\\\vdots\\\frac{[2(t-x)]^{n-2}}{(n-2)!}F^{(n-2)}(t)\\\frac{[2(t-x)]^{n-1}}{(n-1)!}F^{(n-1)}(t)\\\frac{[2(t-x)]^{n}}{n!}F^{(n)}(t)\end{pmatrix}\tag{3.5}$$

for $n\in\mathbb{N}$, where $A_n^{-1}=(b_{i,j})_{n\times n}$ denotes the inverse matrix of A_n.

By the software Mathematica, we can obtain immediately that

$$A_7^{-1}=\begin{pmatrix}1&0&0&0&0&0\\1&1&0&0&0&0\\0&2&1&0&0&0\\0&1&3&1&0&0\\0&0&3&4&1&0\\0&0&1&6&5&1\end{pmatrix}^{-1}=\begin{pmatrix}1&0&0&0&0&0\\-1&1&0&0&0&0\\2&-2&1&0&0&0\\-5&5&-3&1&0&0\\14&-14&9&-4&1&0\\-42&42&-28&14&-5&1\end{pmatrix}.\tag{3.6}$$

The first few values of the sequence $T(r,c)$ can be listed as Table 1, where $T(r,c)$ denote the rth element in column c for $r,c\geq1$, see [12, p. 113]. Comparing Table 1 and the inverse matrix (3.6),

Table 1. Definition of $T(r,c)$

	1	2	3	4	5
1	1				
2	1	2			
3	1	3	5		
4	1	4	9	14	
5	1	5	14	28	42

we should infer that

$$T(k+m,k)=(-1)^{k+1}b_{k+m+1,m+2},\quad k\geq1,\quad m\geq0.$$

Hence, by Lemma 2.4, we should obtain

$$b_{p,q}=(-1)^{p-q}T(p-1,p-q+1)=(-1)^{p-q}\frac{q}{p}\binom{2p-q-1}{p-1},\quad p\geq q\geq2.$$

It is easy to see that the formula

$$b_{p,q}=(-1)^{p-q}\frac{q}{p}\binom{2p-q-1}{p-1}$$

should be valid for all $p\geq q\geq1$. This should imply that

$$(-1)^n[2(x-t)]^{2n}F^{n+1}(t)=\sum_{k=1}^{n}b_{n,k}\frac{[2(t-x)]^k}{k!}F^{(k)}(t),\quad n\in\mathbb{N}.\tag{3.7}$$

We now start out to inductively verify the equation (3.7). When $n=1,2$, the equation (3.7) are

$$-[2(x-t)]^2F^2(t)=b_{1,1}\frac{2(t-x)}{1!}F'(t)=b_{1,1}\frac{2(t-x)}{1!}\frac{2x-2t}{(1-2tx+t^2)^2}$$

and

$$\begin{aligned}[2(x-t)]^4F^3(t)&=\sum_{k=1}^{2}b_{2,k}\frac{[2(t-x)]^k}{k!}F^{(k)}(t)\\
&=b_{2,1}\frac{2(t-x)}{1!}F'(t)+b_{2,2}\frac{[2(t-x)]^2}{2!}F''(t)\\
&=b_{2,1}\frac{2(t-x)}{1!}\frac{2x-2t}{(1-2tx+t^2)^2}+b_{2,2}\frac{[2(t-x)]^2}{2!}\frac{2\bigl(3t^2-6tx+4x^2-1\bigr)}{(t^2-2tx+1)^3}\end{aligned}$$

which are clearly valid. When $n\ge3$, we rewrite (3.7) as

$$(-1)^nF^{n+1}(t)=\sum_{k=1}^{n}b_{n,k}\frac{[2(t-x)]^{k-2n}}{k!}F^{(k)}(t). \tag{3.8}$$

Differentiating with respect to t on both sides of (3.8) yields

$$\begin{aligned}(-1)^n(n+1)F^n(t)F'(t)&=\sum_{k=1}^{n}\frac{b_{n,k}}{k!}\bigl\{2(k-2n)[2(t-x)]^{k-2n-1}F^{(k)}(t)+[2(t-x)]^{k-2n}F^{(k+1)}(t)\bigr\}\\
&=\sum_{k=1}^{n}\frac{b_{n,k}}{k!}2(k-2n)[2(t-x)]^{k-2n-1}F^{(k)}(t)+\sum_{k=1}^{n}\frac{b_{n,k}}{k!}[2(t-x)]^{k-2n}F^{(k+1)}(t)\\
&=\sum_{k=1}^{n}\frac{2(k-2n)b_{n,k}}{k!}[2(t-x)]^{k-2n-1}F^{(k)}(t)+\sum_{k=2}^{n+1}\frac{b_{n,k-1}}{(k-1)!}[2(t-x)]^{k-1-2n}F^{(k)}(t)\\
&=\frac{b_{n,1}}{1!}\frac{2(1-2n)}{[2(t-x)]^{2n}}F'(t)+\frac{b_{n,n}}{n!}\frac{1}{[2(t-x)]^n}F^{(n+1)}(t)\\
&\quad+\sum_{k=2}^{n}\biggl[\frac{b_{n,k}}{k!}2(k-2n)+\frac{b_{n,k-1}}{(k-1)!}\biggr][2(t-x)]^{k-2n-1}F^{(k)}(t)\end{aligned}$$

which can be rearranged as

$$\begin{aligned}(-1)^{n+1}F^{n+2}(t)&=\frac{2(1-2n)b_{n,1}}{n+1}\frac{[2(t-x)]^{1-2(n+1)}}{1!}F'(t)\\
&\quad+b_{n,n}\frac{[2(t-x)]^{(n+1)-2(n+1)}}{(n+1)!}F^{(n+1)}(t)\\
&\quad+\sum_{k=2}^{n}\frac{2(k-2n)b_{n,k}+kb_{n,k-1}}{n+1}\frac{[2(t-x)]^{k-2(n+1)}}{k!}F^{(k)}(t).\end{aligned}$$

It is easy to see that

$$\frac{2(1-2n)b_{n,1}}{n+1}=\frac{2(1-2n)}{n+1}(-1)^{n-1}\frac{1}{n}\binom{2n-2}{n-1}=(-1)^n\frac{1}{n+1}\binom{2n}{n}=b_{n+1,1}.$$

 doi:10.20944/preprints201703.0209.v1

Since $b_{k,k} = 1$ for all $1 \le k \le n \in \mathbb{N}$, it is sufficient to show

$$\frac{2(k-2n)b_{n,k} + kb_{n,k-1}}{n+1} = b_{n+1,k} \tag{3.9}$$

for $2 \le k \le n$. This is equivalent to

$$\frac{2(k-2n)}{n+1}(-1)^{n-k}\frac{k}{n}\binom{2n-k-1}{n-1} + \frac{k}{n+1}(-1)^{n-k+1}\frac{k-1}{n}\binom{2n-k}{n-1} \\ = (-1)^{n+1-k}\frac{k}{n+1}\binom{2n-k+1}{n}$$

which can be verified straightforwardly. The equation (3.7), which can be reformulated as (3.2) for $n \in \mathbb{N}$, is thus proved.

The formulas (3.3) and (3.4) follow readily from taking $t \to 0$ on both sides of (3.1) and (3.2) respectively. The proof of Theorem 3.1 is complete. $\square$

4. Inverse of a triangular matrix

In this section, basing on equations (3.1) and (3.2), we derive the inverse of an integer, unit, and lower triangular matrix.

Theorem 4.1. *For $n \in \mathbb{N}$, let*

$$A_n = (a_{i,j})_{n\times n} = \begin{pmatrix}
\binom{1}{0} & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & 0\\
\binom{1}{1} & \binom{2}{0} & 0 & 0 & \cdots & 0 & 0 & 0 & 0\\
0 & \binom{2}{1} & \binom{3}{0} & 0 & \cdots & 0 & 0 & 0 & 0\\
0 & \binom{2}{2} & \binom{3}{1} & \binom{4}{0} & \cdots & 0 & 0 & 0 & 0\\
0 & 0 & \binom{3}{2} & \binom{4}{1} & \cdots & 0 & 0 & 0 & 0\\
0 & 0 & \binom{3}{3} & \binom{4}{2} & \cdots & 0 & 0 & 0 & 0\\
0 & 0 & 0 & \binom{4}{3} & \cdots & 0 & 0 & 0 & 0\\
\vdots & \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots\\
0 & 0 & 0 & 0 & \cdots & \binom{n-3}{0} & 0 & 0 & 0\\

0 & 0 & 0 & 0 & \cdots & \binom{n-3}{2} & \binom{n-2}{1} & \binom{n-1}{0} & 0\\
0 & 0 & 0 & 0 & \cdots & \binom{n-3}{3} & \binom{n-2}{2} & \binom{n-1}{1} & \binom{n}{0}
\end{pmatrix},$$

where

$$a_{i,j} = \begin{cases} 0, & i < j \\ \dbinom{j}{i-j}, & j \le i \le 2j \\ 0, & i > 2j \end{cases}$$

for $1\le i,j\le n$. *Then*

$$
\begin{aligned}
A_n^{-1}&=(b_{i,j})_{n\times n}\\
&=\begin{pmatrix}
1 & 0 & 0 & \cdots & 0 & 0 & 0\\
-1 & 1 & 0 & \cdots & 0 & 0 & 0\\
2 & -2 & 1 & \cdots & 0 & 0 & 0\\
-5 & 5 & -3 & \cdots & 0 & 0 & 0\\
14 & -14 & 9 & \cdots & 0 & 0 & 0\\
-42 & 42 & -28 & \cdots & 0 & 0 & 0\\
\vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots\\
\frac{(-1)^{n-1}}{n-2}\binom{2n-6}{n-3} & \frac{(-1)^{n}2}{n-2}\binom{2n-7}{n-3} & \frac{(-1)^{n-1}3}{n-2}\binom{2n-8}{n-3} & \cdots & 1 & 0 & 0\\
\frac{(-1)^{n}}{n-1}\binom{2n-4}{n-2} & \frac{(-1)^{n-1}2}{n-1}\binom{2n-5}{n-2} & \frac{(-1)^{n}3}{n-1}\binom{2n-6}{n-2} & \cdots & -(n-2) & 1 & 0\\
\frac{(-1)^{n-1}}{n}\binom{2n-2}{n-1} & \frac{(-1)^{n}2}{n}\binom{2n-3}{n-1} & \frac{(-1)^{n-1}3}{n}\binom{2n-4}{n-1} & \cdots & \frac{n-2}{n}\binom{n+1}{n-1} & -(n-1) & 1
\end{pmatrix},
\end{aligned}
$$

where

$$
b_{i,j}=\begin{cases}0, & 1\le i<j\le n;\\ (-1)^{i-j}\dfrac{j}{i}\dbinom{2i-j-1}{i-1}, & n\ge i>j\ge 1.\end{cases} \tag{4.1}
$$

Proof. This follows straightforwardly from combining (3.5) with (3.2). The proof of Theorem 4.1 is complete. ☐

5. Identities of the Catalan numbers

In this section, we present several identities of the Catalan numbers C_k.

Theorem 5.1. *For* $i\ge j\ge 1$, *we have*

$$
\sum_{\ell=0}^{\lfloor (j-1)/2\rfloor}(-1)^\ell\binom{j-\ell-1}{\ell}C_{i-\ell-1}=\frac{j}{i}\binom{2i-j-1}{i-1}. \tag{5.1}
$$

Proof. Observing the special result (3.6), we guess that the elements $b_{i,j}$ of the inverse of the triangular matrix A_n should satisfy the following relations:

(1) for $i<j$, the elements in the upper triangle are $b_{i,j}=0$;
(2) for all $i\in\mathbb{N}$, the elements on the main diagonal are $b_{i,i}=1$;
(3) the elements in the first two columns satisfy $b_{i,1}=-b_{i,2}$ for $i\ge 2$;
(4) the elements in the first column are $b_{i,1}=(-1)^{i-1}C_{i-1}$;
(5) for $1\le i\le n-1$ and $1\le j\le n-2$,

$$b_{i+1,j+2}=b_{i,j}-b_{i+1,j+1};$$

(6) for $i\ge j\ge 2$,

$$b_{i,j}=\sum_{k=-1}^{i-j-1}(-1)^{k+1}b_{i-1,j+k}.$$

Basing on these observations, we guess out that the elements $b_{i,j}$ should alternatively satisfy

$$
b_{i,j}=(-1)^{i-j}\sum_{\ell=0}^{\lfloor (j-1)/2\rfloor}(-1)^\ell\binom{j-\ell-1}{\ell}C_{i-\ell-1},\quad i\ge j\ge 1. \tag{5.2}
$$

Combining this with (4.1) and simplifying yield the identity (5.1).

We now start off to verify the identity (5.1). By virtue of the integral representation (2.4), the formula (2.5) in Lemma 2.6, and the integral (2.8) in Lemma 2.7, we acquire

$$
\begin{aligned}
&\sum_{\ell=0}^{\lfloor (j-1)/2\rfloor}(-1)^\ell\binom{j-\ell-1}{\ell}C_{i-\ell-1}\\
&=\frac{1}{2\pi}\int_0^4\sqrt{\frac{4-x}{x}}\,\Biggl[\sum_{\ell=0}^{\lfloor (j-1)/2\rfloor}(-1)^\ell\binom{j-\ell-1}{\ell}x^{i-\ell-1}\Biggr]\,\mathrm{d}\,x\\
&=\frac{1}{2\pi}\int_0^4 x^{i-3/2}(4-x)^{1/2}\Biggl[\sum_{\ell=0}^{\lfloor (j-1)/2\rfloor}\frac{(j-1-\ell)!}{(j-1-2\ell)!}\frac{1}{\ell!}\biggl(-\frac{1}{x}\biggr)^\ell\Biggr]\,\mathrm{d}\,x\\
&=\frac{1}{2\pi}\int_0^4 x^{i-3/2}(4-x)^{1/2}\Biggl[\sum_{\ell=0}^{\lfloor (j-1)/2\rfloor}\frac{\bigl(\frac{1-j}{2}\bigr)_\ell\bigl(\frac{2-j}{2}\bigr)_\ell}{(1-j)_\ell}\frac{1}{\ell!}\biggl(\frac{4}{x}\biggr)^\ell\Biggr]\,\mathrm{d}\,x\\
&=\frac{1}{2\pi}\int_0^4 x^{i-3/2}(4-x)^{1/2}\Biggl[\sum_{\ell=0}^{\infty}\frac{\bigl(\frac{1-j}{2}\bigr)_\ell\bigl(\frac{2-j}{2}\bigr)_\ell}{(1-j)_\ell}\frac{1}{\ell!}\biggl(\frac{4}{x}\biggr)^\ell\Biggr]\,\mathrm{d}\,x\\
&=\frac{1}{2\pi}\int_0^4 x^{i-3/2}(4-x)^{1/2}{}_2F_1\biggl(\frac{1-j}{2},\frac{2-j}{2};1-j;\frac{4}{x}\biggr)\,\mathrm{d}\,x\\
&=\frac{4^i}{2\pi}\int_0^1 t^{i-3/2}(1-t)^{1/2}{}_2F_1\biggl(\frac{1-j}{2},\frac{2-j}{2};1-j;\frac{1}{t}\biggr)\,\mathrm{d}\,t\\
&=\frac{4^i}{2\pi}\int_0^1 t^{i-3/2}(1-t)^{1/2}\frac{1}{2^j}\frac{\sqrt{t}}{\sqrt{t-1}}\Biggl[\biggl(1+\frac{\sqrt{t-1}}{\sqrt{t}}\biggr)^j-\biggl(1-\frac{\sqrt{t-1}}{\sqrt{t}}\biggr)^j\Biggr]\,\mathrm{d}\,t\\
&=\frac{2^{2i-j}}{2\pi}\boldsymbol{i}\int_0^1 t^{i-1}\Biggl[\biggl(1+\sqrt{1-\frac{1}{t}}\,\biggr)^j-\biggl(1-\sqrt{1-\frac{1}{t}}\,\biggr)^j\Biggr]\,\mathrm{d}\,t\quad \bigl(\boldsymbol{i}=\sqrt{-1}\,\bigr)\\
&=\frac{2^{2i-j}}{\pi}\boldsymbol{i}\int_0^\infty\frac{s}{(1+s^2)^{i+1}}\bigl[(1-\boldsymbol{i}s)^j-(1+\boldsymbol{i}s)^j\bigr]\,\mathrm{d}\,s\\
&=\frac{2^{2i-j}}{\pi}\boldsymbol{i}\int_0^\infty\frac{s}{(1+s^2)^{i+1}}\Bigl[\Bigl(\sqrt{1+s^2}\,e^{-\boldsymbol{i}\arctan s}\Bigr)^j-\Bigl(\sqrt{1+s^2}\,e^{\boldsymbol{i}\arctan s}\Bigr)^j\Bigr]\,\mathrm{d}\,s\\
&=\frac{2^{2i-j}}{\pi}\boldsymbol{i}\int_0^\infty\frac{s}{(1+s^2)^{i-j/2+1}}\bigl(e^{-\boldsymbol{i}j\arctan s}-e^{\boldsymbol{i}j\arctan s}\bigr)\,\mathrm{d}\,s\\
&=\frac{2^{2i-j}}{\pi}\int_0^\infty\frac{s}{(1+s^2)^{i-j/2+1}}\sin(j\arctan s)\,\mathrm{d}\,s\\
&=\frac{2^{2i-j}}{\pi}\int_0^{\pi/2}\frac{\tan t}{(1+\tan^2t)^{i-j/2+1}}\sin(jt)\sec^2t\,\mathrm{d}\,t\\
&=\frac{2^{2i-j}}{\pi}\int_0^{\pi/2}\frac{\tan t}{\sec^{2i-j}t}\sin(jt)\,\mathrm{d}\,t\\
&=\frac{2^{2i-j}}{\pi}\int_0^{\pi/2}\sin t\cos^{2i-j-1}t\sin(jt)\,\mathrm{d}\,t
\end{aligned}
$$

$$
\begin{aligned}
&= \frac{2^{2i-j}}{\pi}\int_0^{\pi/2}[\cos((j-1)t)-\cos((j+1)t)]\cos^{2i-j-1}t\,\mathrm{d}\,t\\
&= \frac{2^{2i-j}}{\pi}\biggl[\frac{\pi}{2^{2i-j}(2i-j)B(i,i-j+1)}-\frac{\pi}{2^{2i-j}(2i-j)B(i+1,i-j)}\biggr]\\
&= \frac{1}{2i-j}\biggl[\frac{1}{B(i,i-j+1)}-\frac{1}{B(i+1,i-j)}\biggr]\\
&= \frac{1}{2i-j}\biggl[\frac{\Gamma(2i-j+1)}{\Gamma(i)\Gamma(i-j+1)}-\frac{\Gamma(2i-j+1)}{\Gamma(i+1)\Gamma(i-j)}\biggr]\\
&= (2i-j-1)!\biggl[\frac{1}{\Gamma(i)\Gamma(i-j+1)}-\frac{1}{\Gamma(i+1)\Gamma(i-j)}\biggr]\\
&= (2i-j-1)!\biggl[\frac{1}{(i-1)!(i-j)!}-\frac{1}{i!(i-j-1)!}\biggr]\\
&= \frac{j}{i}\binom{2i-j-1}{i-1}.
\end{aligned}
$$

The identity (5.1) is thus proved. The proof of Theorem 5.1 is complete. □

Theorem 5.2. *For $i,j,n\in\mathbb{N}$, the Catalan numbers C_n satisfy*

$$\sum_{k=0}^{\lfloor n/2\rfloor}(-1)^k\binom{n-k}{k}C_{n-k}=1, \tag{5.3}$$

$$\sum_{\substack{i\le 2\ell\le 2i\\ \ell\ge j}}\sum_{k=0}^{\lfloor (j-1)/2\rfloor}(-1)^{\ell-k}\binom{\ell}{i-\ell}\binom{j-k-1}{k}C_{\ell-k-1}=0, \tag{5.4}$$

and

$$\sum_{\substack{i\ge \ell\ge j\\ \ell\le 2j}}\sum_{k=0}^{\lfloor (\ell-1)/2\rfloor}(-1)^{\ell-k}\binom{j}{\ell-j}\binom{\ell-k-1}{k}C_{i-k-1}=0. \tag{5.5}$$

Proof. This follows from expanding the matrix equation

$$A_nA_n^{-1}=A_n^{-1}A_n=I_n \tag{5.6}$$

and utilizing the expression (5.2) in Theorem 4.1, where I_n stands for the identity matrix of n orders. This can be written in details as follows.

The matrix equation (5.6) is equivalent to

$$\sum_{\ell=1}^{n}a_{i,\ell}b_{\ell,j}=\begin{cases}0, & i<j\\ \displaystyle\sum_{\ell=j}^{i}a_{i,\ell}b_{\ell,j}, & i\ge j\end{cases}=\begin{cases}0, & i\ne j\\ 1, & i=j\end{cases}$$

and

$$\sum_{\ell=1}^{n}b_{i,\ell}a_{\ell,j}=\begin{cases}0, & i<j\\ \displaystyle\sum_{\ell=j}^{i}b_{i,\ell}a_{\ell,j}, & i\ge j\end{cases}=\begin{cases}0, & i\ne j\\ 1, & i=j\end{cases}$$

Preprints (www.preprints.org) | NOT PEER-REVIEWED | Posted: 28 March 2017 doi:10.20944/preprints201703.0209.v1

which can be rearranged as

$$\sum_{\ell=j}^{i} a_{i,\ell}b_{\ell,j} = \begin{cases} 0, & i>j \\ 1, & i=j \end{cases} \quad \text{or} \quad \sum_{\ell=j}^{i} b_{i,\ell}a_{\ell,j} = \begin{cases} 0, & i>j \\ 1, & i=j \end{cases}$$

for $1\le i,j\le n$.

When $1\le i=j\le n$, it follows that

$$\begin{aligned} 1&=\sum_{\ell=j}^{i} a_{i,\ell}b_{\ell,j}=\sum_{\ell=j}^{i} b_{i,\ell}a_{\ell,j}=a_{i,i}b_{i,i}=b_{i,i}\\ &=\sum_{k=0}^{i-1}(-1)^k\binom{i-k-1}{k}C_{i-k-1}=\sum_{k=0}^{\lfloor (i-1)/2\rfloor}(-1)^k\binom{i-k-1}{k}C_{i-k-1}. \end{aligned}$$

The identity (5.3) is thus concluded.

When $1\le j<i\le n$, it follows that

$$\begin{aligned} 0&=\sum_{\ell=j}^{i} a_{i,\ell}b_{\ell,j}=\sum_{\substack{i/2\le\ell\le i\\ \ell\ge j}} a_{i,\ell}b_{\ell,j}\\ &=\sum_{\substack{i/2\le\ell\le i\\ \ell\ge j}}\binom{\ell}{i-\ell}(-1)^{\ell-j}\sum_{k=0}^{\lfloor (j-1)/2\rfloor}(-1)^k\binom{j-k-1}{k}C_{\ell-k-1}\\ &=(-1)^j\sum_{\substack{i/2\le\ell\le i\\ \ell\ge j}}\sum_{k=0}^{\lfloor (j-1)/2\rfloor}(-1)^{\ell-k}\binom{\ell}{i-\ell}\binom{j-k-1}{k}C_{\ell-k-1} \end{aligned}$$

and

$$\begin{aligned} 0&=\sum_{\ell=j}^{i} b_{i,\ell}a_{\ell,j}=\sum_{\substack{i\ge\ell\ge j\\ \ell\le 2j}} b_{i,\ell}a_{\ell,j}\\ &=\sum_{\substack{i\ge\ell\ge j\\ \ell\le 2j}}(-1)^{i-\ell}\sum_{k=0}^{\lfloor (\ell-1)/2\rfloor}(-1)^k\binom{\ell-k-1}{k}C_{i-k-1}\binom{j}{\ell-j}\\ &=(-1)^i\sum_{\substack{i\ge\ell\ge j\\ \ell\le 2j}}\sum_{k=0}^{\lfloor (\ell-1)/2\rfloor}(-1)^{\ell-k}\binom{j}{\ell-j}\binom{\ell-k-1}{k}C_{i-k-1}. \end{aligned}$$

The identities (5.4) and (5.5) are thus derived. The proof of Theorem 5.2 is complete. □

Theorem 5.3. *Let $m,n\in\mathbb{N}$. If $n\ge 2m\ge 2$, then*

$$\frac{\sum_{\ell=0}^{m-1}(-1)^\ell\binom{2m-\ell-1}{\ell}\frac{n+2\ell+1}{n-\ell+1}C_{n-\ell-1}}{\sum_{\ell=0}^{m-1}(-1)^\ell\binom{2m-\ell-2}{\ell}\frac{1}{2m-2\ell-1}C_{n-\ell-1}}=m(2m-1). \tag{5.7}$$

Proof. Employing the expression (5.2) and making use of Theorem 5.1, we can write the recursive equation (3.9) as

$$\begin{aligned}
2(k-2n)(-1)^{n-k}&\sum_{\ell=0}^{\lfloor(k-1)/2\rfloor}(-1)^{\ell}\binom{k-\ell-1}{\ell}C_{n-\ell-1}\\
&+k(-1)^{n-k+1}\sum_{\ell=0}^{\lfloor(k-2)/2\rfloor}(-1)^{\ell}\binom{k-\ell-2}{\ell}C_{n-\ell-1}\\
&=(-1)^{n-k+1}\Biggl\{k\sum_{\ell=0}^{\lfloor(k-2)/2\rfloor}(-1)^{\ell}\binom{k-\ell-2}{\ell}C_{n-\ell-1}\\
&\quad-2(k-2n)\sum_{\ell=0}^{\lfloor(k-1)/2\rfloor}(-1)^{\ell}\binom{k-\ell-1}{\ell}C_{n-\ell-1}\Biggr\}\\
&=(-1)^{n-k+1}(n+1)\sum_{\ell=0}^{\lfloor(k-1)/2\rfloor}(-1)^{\ell}\binom{k-\ell-1}{\ell}C_{n-\ell}
\end{aligned}$$

for $n\ge2$, that is,

$$\begin{aligned}
k\sum_{\ell=0}^{\lfloor(k-2)/2\rfloor}(-1)^{\ell}\binom{k-\ell-2}{\ell}C_{n-\ell-1}-2(k-2n)&\sum_{\ell=0}^{\lfloor(k-1)/2\rfloor}(-1)^{\ell}\binom{k-\ell-1}{\ell}C_{n-\ell-1}\\
&=(n+1)\sum_{\ell=0}^{\lfloor(k-1)/2\rfloor}(-1)^{\ell}\binom{k-\ell-1}{\ell}C_{n-\ell},\quad n\ge2.
\end{aligned}\tag{5.8}$$

When $k=2m$ and $m\in\mathbb{N}$, the equation (5.8) is equivalent to

$$\begin{gathered}
2m\sum_{\ell=0}^{m-1}(-1)^{\ell}\binom{2m-\ell-2}{\ell}C_{n-\ell-1}-4(m-n)\sum_{\ell=0}^{m-1}(-1)^{\ell}\binom{2m-\ell-1}{\ell}C_{n-\ell-1}\\
=(n+1)\sum_{\ell=0}^{m-1}(-1)^{\ell}\binom{2m-\ell-1}{\ell}C_{n-\ell},\\
2m\sum_{\ell=0}^{m-1}(-1)^{\ell}\binom{2m-\ell-2}{\ell}C_{n-\ell-1}-4m\sum_{\ell=0}^{m-1}(-1)^{\ell}\binom{2m-\ell-1}{\ell}C_{n-\ell-1}\\
=(n+1)\sum_{\ell=0}^{m-1}(-1)^{\ell}\binom{2m-\ell-1}{\ell}C_{n-\ell}-4n\sum_{\ell=0}^{m-1}(-1)^{\ell}\binom{2m-\ell-1}{\ell}C_{n-\ell-1},\\
2m\sum_{\ell=0}^{m-1}(-1)^{\ell}\left[\binom{2m-\ell-2}{\ell}-2\binom{2m-\ell-1}{\ell}\right]C_{n-\ell-1}\\
=\sum_{\ell=0}^{m-1}(-1)^{\ell}\binom{2m-\ell-1}{\ell}[(n+1)C_{n-\ell}-4nC_{n-\ell-1}],
\end{gathered}$$

and

$$m(2m-1)\sum_{\ell=0}^{m-1}(-1)^\ell\frac{(2m-\ell-2)!}{\ell!(2m-2\ell-1)!}C_{n-\ell-1}=\sum_{\ell=0}^{m-1}(-1)^\ell\binom{2m-\ell-1}{\ell}\frac{n+2\ell+1}{n-\ell+1}C_{n-\ell-1}$$

which can be rearranged as

$$\sum_{\ell=0}^{m-1}(-1)^\ell\biggl[m(2m-1)-\frac{(2m-\ell-1)(n+2\ell+1)}{n-\ell+1}\biggr]\frac{(2m-\ell-2)!}{\ell!(2m-2\ell-1)!}C_{n-\ell-1}=0$$

for $n\ge 2m\ge 2$. This can be further rewritten as (5.7). The proof of Theorem 5.3 is complete. □

6. Remarks

Finally, we give some remarks on the closely related results stated in previous sections.

Remark 6.1. Now we explain the motivation of Theorem 3.1 as follows. In [11], the following results were inductively and recursively obtained.

(1) The nonlinear differential equations

$$2^nn!F^{n+1}(t)=\sum_{i=1}^n a_i(n)(x-t)^{i-2n}F^{(i)}(t),\quad n\in\mathbb{N}$$

has a solution

$$F(t)=F(t,x)=\frac{1}{1-2tx+t^2},$$

where $a_1(n)=(2n-3)!!$ and

$$\begin{aligned}a_i(n)={}&\sum_{k_{i-1}=0}^{n-i}\sum_{k_{i-2}=0}^{n-i-k_{i-1}}\cdots\sum_{k_1=0}^{n-i-k_{i-1}-\dots-k_2}2^{\sum_{j=1}^{i-1}k_j}\\&\times\prod_{j=2}^{i}\biggl\langle n-\sum_{\ell=j}^{i-1}k_\ell-\frac{2i+2-j}{2}\biggr\rangle_{k_{j-1}}\Biggl(2\Biggl(n-i-\sum_{j=1}^{i-1}k_j\Biggr)-1\Biggr)!!\end{aligned}\tag{6.1}$$

for $2\le i\le n$, with the notation that

$$\langle x\rangle_n=\prod_{k=0}^{n-1}(x-k)=\begin{cases}x(x-1)\cdots(x-n+1), & n\ge1\\1, & n=0\end{cases}$$

is the falling factorial and that the double factorial of negative odd integers $-2n-1$ is defined by

$$(-2n-1)!!=\frac{(-1)^n}{(2n-1)!!}=(-1)^n\frac{2^nn!}{(2n)!}$$

for $n\ge0$. See [11, Theorem 1].

(2) The higher order Chebyshev polynomials of the second kind $U_n^{(\alpha)}(x)$ generated by

$$\biggl(\frac{1}{1-2xt+t^2}\biggr)^\alpha=\sum_{n=0}^\infty U_n^{(\alpha)}(x)t^n$$

Preprints (www.preprints.org) | NOT PEER-REVIEWED | Posted: 28 March 2017 doi:10.20944/preprints201703.0209.v1

satisfy

$$U_n^{(k+1)}(x)=\frac{1}{2^k k!}\sum_{i=1}^{k}a_i(k)\sum_{\ell=0}^{n}\binom{2k+n-\ell-i-1}{n-\ell}U_{\ell+i}(x)x^{i+\ell-2k-n}\langle \ell+i\rangle_i$$

for $k\in\mathbb{N}$, where $U_n^{(1)}(x)=U_n(x)$. See [11, Theorem 2].

(3) The higher order Legendre polynomials $p_n^{(\alpha)}(x)$ generated by

$$\left(\frac{1}{\sqrt{1-2xt+t^2}}\right)^{\alpha}=\sum_{n=0}^{\infty}p_n^{(\alpha)}(x)t^n$$

satisfy

$$\sum_{\ell=0}^{n}p_\ell^{(k+1)}(x)p_{n-\ell}^{(k+1)}(x)=\frac{1}{2^k k!}\sum_{i=1}^{k}a_i(k)\sum_{\ell=0}^{n}\binom{2k+n-\ell-i-1}{n-\ell}U_{\ell+i}(x)\langle \ell+i\rangle_i x^{i+\ell-2k-n}$$

for $k\in\mathbb{N}$ and $n\ge 0$ and

$$U_n^{(k+1)}(x)=\frac{1}{2^k k!}\sum_{i=1}^{k}a_i(k)\sum_{\ell=0}^{n}\sum_{j=0}^{\ell+i}\binom{2k+n-\ell-i-1}{n-\ell}x^{i+\ell-2k-n}\langle \ell+i\rangle_i p_{\ell+i-j}(x)$$

for $k,n\in\mathbb{N}$, where $p_n^{(1)}(x)=p_n(x)$. See [11, Corollaries 3 and 4].

(4) The higher order Chebyshev polynomials of the third kind $V_n^{(\alpha)}(x)$ generated by

$$\left(\frac{1-t}{\sqrt{1-2xt+t^2}}\right)^{\alpha}=\sum_{n=0}^{\infty}V_n^{(\alpha)}(x)t^n$$

satisfy

$$\begin{aligned}\sum_{\ell=0}^{n}\binom{k+n-\ell}{n-\ell}V_\ell^{(k+1)}(x)&=\frac{1}{2^k k!}\sum_{i=1}^{k}\sum_{\ell=0}^{i}a_i(k)\frac{i!}{\ell!}\\&\quad\times\sum_{m+s+p=n}\binom{2k+m-i-1}{m}\binom{i-\ell+s}{s}\langle \ell+p\rangle_\ell x^{i-2k-m}V_{\ell+p}(x)\end{aligned}$$

for $k\in\mathbb{N}$ and $n\ge 0$, where $V_n^{(1)}(x)=V_n(x)$. See [11, Theorem 5].

(5) The higher order Chebyshev polynomials of the fourth kind $W_n^{(\alpha)}(x)$ generated by

$$\left(\frac{1+t}{\sqrt{1-2xt+t^2}}\right)^{\alpha}=\sum_{n=0}^{\infty}W_n^{(\alpha)}(x)t^n$$

satisfy

$$\begin{aligned}\sum_{\ell=0}^{n}(-1)^{n-\ell}\binom{k+n-\ell}{n-\ell}W_\ell^{(k+1)}(x)&=\frac{1}{2^k k!}\sum_{i=1}^{k}\sum_{\ell=0}^{i}(-1)^{i-\ell}a_i(k)\frac{i!}{\ell!}\\&\quad\times\sum_{m+s+p=n}(-1)^s\binom{2k+m-i-1}{m}\binom{i-\ell+s}{s}\langle \ell+p\rangle_\ell x^{i-2k-m}W_{\ell+p}(x)\end{aligned}$$

for $k\in\mathbb{N}$ and $n\ge 0$, where $W_n^{(1)}=W_n(x)$. See [11, Theorem 6].

Preprints (www.preprints.org) | NOT PEER-REVIEWED | Posted: 28 March 2017 doi:10.20944/preprints201703.0209.v1

(6) The higher order Chebyshev polynomials of the first kind $T_n^{(\alpha)}(x)$ generated by
$$\left(\frac{1-t^2}{\sqrt{1-2xt+t^2}}\right)^\alpha=\sum_{n=0}^\infty T_n^{(\alpha)}(x)t^n$$
satisfy
$$2^{k+1}k!\sum_{s+m+p=n}\binom{k+s}{s}\binom{m+k}{m}(-1)^mT_p^{(k+1)}(x)$$
$$=\sum_{i=1}^k\sum_{\ell=0}^i a_i(k)\frac{i!}{\ell!}\sum_{m+s+p=n}\binom{2k+m-i-1}{m}\binom{i+s-\ell}{s}\langle\ell+p\rangle_\ell x^{i-2k-m}T_{p+\ell}(x)$$
$$+\sum_{i=1}^k\sum_{\ell=0}^i a_i(k)\frac{i!}{\ell!}(-1)^{i-\ell}\sum_{m+s+p=n}(-1)^s\binom{2k+m-i-1}{m}\binom{i+s-\ell}{s}\langle\ell+p\rangle_\ell x^{i-2k-m}T_{p+\ell}(x)$$
for $k\in\mathbb{N}$ and $n\ge0$. See [11, Theorem 7].

It is clear that the quantities $a_i(n)$ defined by (6.1) play a key role in the above-mentioned conclusions obtained in the paper [11]. However, the quantities $a_i(n)$ are expressed complicatedly and can not be computed easily. Can one find a simple expression for the quantities $a_i(n)$? Theorem 3.1 answers this question by
$$a_k(n)=\frac{(-1)^{n-k}}{2^{n-k}}\frac{n!}{k!}b_{n,k}=\frac{1}{2^{n-k}}\frac{(n-1)!}{(k-1)!}\binom{2n-k-1}{n-1} \tag{6.2}$$
for $n\ge k\ge1$. By this much simpler expression for $a_k(n)$, we can reformulate all the above-mentioned main results in the paper [11] in terms of the quantities defined in (6.2). For saving time of the authors and space of this paper, we do not write down them in details.

Due to the same motivation and reason as Theorem 3.1, the authors composed and published the papers [10, 19, 20, 21, 35, 36, 37, 38, 48, 49, 50, 57, 58], for examples.

Remark 6.2. The identity (5.3) recovers [61, p. 2187, Theorem 2, Eq. (15b)]. It can also be verified alternatively and directly by the same method used in the proof of the identity (5.1).

Actually, the identity (5.3) is a special case $i=j\in\mathbb{N}$ of the identity (5.1). In other words, the identity (5.1) generalizes, or say, extends (5.3).

It is clear that the proof of the identity (5.3) is simpler than the one of (5.3) adopted in [61] and related references therein.

Remark 6.3. The integral representation (2.4) for the Catalan numbers C_k and its variant forms can be found in [3, 4, 5, 6, 16, 17, 44] and the closely related references therein.

In recent years, there are plenty of literature, such as [14, 18, 25, 27, 31, 32, 40, 41, 44, 46, 47, 59, 62, 63], dedicated to generalizations of the Catalan numbers C_n and to investigating their properties.

Remark 6.4. The formula (2.3) in Lemma 2.3 has also been applied many times in some papers such as [9, 26, 29, 33, 36, 38, 39, 42, 43, 45, 51, 56, 60] and the closely related references therein.

Remark 6.5. Let $A_n=I_n+M_n$ and I_n be the identity matrix of order n. By linear algebra, it is easy to see that $M_n^n=0$ and
$$(I_n+M_n)\bigl(I_n-M_n+M_n^2-M_n^3+\dots+(-1)^{n-1}M_n^{n-1}\bigr)=I_n-M_n^n=I_n.$$

This means that

$$A_n^{-1}=(I_n+M_n)^{-1}=I_n+\sum_{k=1}^{n-1}(-1)^kM_n^k.$$

In theory, this formula is useful for computing the inverse A_n^{-1}. But, in practice, it is too difficult to acquire the simple form in (4.1).

Can one conclude a general and concrete formula for computing M_n^k from Theorem 4.1?

Remark 6.6. Motivated by the proof of the identity 5.1, we naturally ask a question: can one explicitly compute integrals of the type

$$\int_0^1 z^{\alpha-1}(1-z)^{\beta-1}{}_pF_q(a,b;c;xz^\sigma)\,\mathrm{d}\,z?$$

In [53, p. 340, Remark], it was given that

$$\int_0^1 z^{\alpha-1}(1-z)^{\beta-1}{}_2F_1(a,b;c;xz^\sigma)\,\mathrm{d}\,z=\frac{\Gamma(c)\Gamma(\beta)}{\Gamma(a)\Gamma(b)}{}_3\Phi_2((a,1),(b,1),(\alpha,\sigma);(c,1),(\alpha+\beta,\sigma);x),$$

where

$${}_p\Phi_q((\alpha_1,\beta_1),\dots,(\alpha_p,\beta_p);(\rho_1,\mu_1),\dots,(\rho_p,\mu_q);z)=\sum_{n=0}^\infty\frac{\Gamma(\alpha_1+\beta_1n)\cdots\Gamma(\alpha_p+\beta_pn)}{\Gamma(\rho_1+\mu_1n)\cdots(\Gamma(\rho_q+\mu_qn))}\frac{z^n}{n!}$$

and β_r,μ_t are real positive numbers such that

$$1+\sum_{t=1}^q\mu_t-\sum_{r=1}^p\beta_r>0.$$

Making use of this result, we can supply an alternative proof of the identity 5.1 in Theorem 5.1.

There is a similar formula in [52, p. 104, Theorem 38].

This question has also been considered in [1, 23] and the closely related references therein.

Remark 6.7. In [15, p. 387, 15.4.18], it was listed that the formula

$${}_2F_1\left(a,a+\frac{1}{2};2a;z\right)=\frac{1}{\sqrt{1-z}}\left(\frac{1}{2}+\frac{\sqrt{1-z}}{2}\right)^{1-2a}$$

holds for the principal branch when $|z|<1$, and by analytic continuation elsewhere. Straightforwardly letting $a=\frac{1-j}{2}$ results in

$${}_2F_1\left(\frac{1-j}{2},\frac{2-j}{2};1-j;t\right)=\frac{1}{\sqrt{1-t}}\left(\frac{1}{2}+\frac{\sqrt{1-t}}{2}\right)^{j},\quad |t|<1.$$

Replacing t by $\frac{1}{t}$ leads to

$${}_2F_1\left(\frac{1-j}{2},\frac{2-j}{2};1-j;\frac{1}{t}\right)=\frac{1}{2^j}\sqrt{\frac{t}{t-1}}\left(1+\sqrt{\frac{t-1}{t}}\right)^{j},\quad |t|>1.$$

This expression for ${}_2F_1\left(\frac{1-j}{2},\frac{2-j}{2};1-j;\frac{1}{t}\right)$ is slightly different from (2.5) in Lemma 2.6.

Remark 6.8. Comparing main results of this paper with those in [28], we can see that there exist some close connections among the Chebyshev polynomials of the second kind U_n, the Catalan numbers C_n, the central Delannoy numbers D_n, the Fibonacci polynomials $F_n(x)$, and triangular and tridiagonal matrices.

Comparing Theorem 3.1 with Theorem 5.1 reveals that the equality (3.4) can be reformulated in terms of the Catalan numbers C_n as

$$\sum_{k=1}^{n}\left[\sum_{\ell=0}^{\lfloor(k-1)/2\rfloor}(-1)^{\ell}\binom{k-\ell-1}{\ell}C_{n-\ell-1}\right](2x)^{k}U_{k}(x)=(2x)^{2n}. \tag{6.3}$$

Taking $x=3$ in (6.3) and considering results in [28, Section 10] disclose that

$$\sum_{k=1}^{n}6^{k}\left[\sum_{\ell=0}^{\lfloor(k-1)/2\rfloor}(-1)^{\ell}\binom{k-\ell-1}{\ell}C_{n-\ell-1}\right]\left[\sum_{\ell=0}^{k}D(\ell)D(k-\ell)\right]=6^{2n},$$

where $D(k)$ denotes the central Delannoy numbers which are combinatorially the numbers of "king walks" from the $(0,0)$ corner of an $n\times n$ square to the upper right corner (n,n) and can be generated analytically by

$$\frac{1}{\sqrt{1-6x+x^2}}=\sum_{k=0}^{\infty}D(k)x^{k}=1+3x+13x^2+63x^3+\cdots.$$

Taking $x=\frac{s}{2}\sqrt{-1}$ in (6.3) and utilizing results in [28, Section 8] expose that

$$\sum_{k=1}^{n}(-1)^{k}\left[\sum_{\ell=0}^{\lfloor(k-1)/2\rfloor}(-1)^{\ell}\binom{k-\ell-1}{\ell}C_{n-\ell-1}\right]s^{k}F_{k+1}(s)=(-1)^{n}s^{2n},$$

where the Fibonacci polynomials

$$F_n(s)=\frac{1}{2^n}\frac{\bigl(s+\sqrt{4+s^2}\,\bigr)^{n}-\bigl(s-\sqrt{4+s^2}\,\bigr)^{n}}{\sqrt{4+s^2}}$$

can be generated by

$$\frac{t}{1-ts-t^2}=\sum_{n=1}^{\infty}F_n(s)t^{n}=t+st^2+\bigl(s^2+1\bigr)t^3+\bigl(s^3+2s\bigr)t^4+\cdots.$$

Remark 6.9. Now we can see that our main results in this paper stride analysis, special functions, combinatorics, number theory, matrix theory, integral transforms, and the like.
