**Abstract:** Western Iran *Barbus* species, are scientifically, environmentally and economically important. Some of them are the largest riverine freshwater species, that will grow in size and weight to 170 cm, and 120 kg respectively. These species although are vulnerable species but there is scarce information on taxonomy or present environmentally status of these exclusive species. *Luciobarbus barbuls* is one of the uniquely significant large species. In order to find new record on present status of large *Barbus* species a sampling program carried out in western Iran, during the resent year since 2013 to now. The validity of *Luciobarbus barbuls* a Cyprinid fish, which several authors have synonymies with different species is reaffirmed. This species overlaps in distinction with *L. mystaceus*, *L. scheich*, and other similar species. In this study re description of *L. barbuls* is given. Our study reviled that *Luciobarbus barbuls*(Heckel 1846) is valid species and differ from *L. mystaceus*, *L. scheich*, *L. kersin*, *L. pectoralis*, *L. rajanorum*. *L. barbuls* is not a subspecies of *Luciobarbus mystaceus* (Heckel 1846). This species differs from *L. mystaceus* in having thick and very wide fleshy lip, inferior mouth and slightly shorter head. In *Luciobarbus barbuls* head is more inferior. The details of differences between these species are given. This species is one of stable growing fish without dimorphism, that retain it's shape from a fingerling species to a giant fish. The details on new record, new photo of this exquisite species and other precious large *Luciobarbus* species are given.

**Keywords:** Cyprinidae; *Luciobarbus barbuls*; *Luciobarbus*, Iran; taxonomy

## 1. Introduction

Identifying of fish species specifically according to original descriptor, is very important. It is substantially is a bases for future distinctive classifying of fishes by modern and precision tools, such as DNA fingerprinting or other molecular or biochemical studies. Without dependable knowledge on identifying different fish species, other kind of analyzing may led to more confusing, mixing and generating useless mass of data [1] Western Iran *Barbus* species, are scientifically, environmentally and economically important species. Some of them are the largest riverine freshwater species, that will grow in size and weight to 170 cm, and 120 kg respectively. These species although are vulnerable, but there is inadequate information on taxonomy or present environmentally status of these exclusive species. *Luciobarbus barbuls* is one of these uniquely significant large species.

*Luciobarbus barbuls* was one of 15 species among specimens collected by Theodor Kotschy 1841 – 1842, in the water system around Shiraz and was sent to Heckel in Vienna Museum (NMW).

*Luciobarbus barbuls* briefly described by Heckel (1849)[2]. But during the last decades it has been reported and described for several times. Despite Heckel(1849) described some of distinctive features of *Luciobarbus barbuls* and outlined its difference with *Luciobarbus mystacus* but from 1970 arise some doubts about validity of this species. However There are also conflicting views on the

validity and synonymy of several nominal "*Barbus*" species. (See more details on [www.briancoad.com](http://www.briancoad.com))[3]

The possible syntype of *Luciobarbus barbatus* (NMW 53957) as stated by Almaça (1986)[4] and Coad (1997)[5] is in too poor condition. As some of morphological and meristic characters of *Luciobarbus barbatus* Heckel (1849), overlap with other similar species such as *L. mystaceus*, *L. scheich*, *L. kersin*, *L. pectoralis*, *L. longiceps*, *L. rajanorum*. These species have been put a problematic group of *Barbus* species. The stated nominal species, more or less have a similar shape with *Luciobarbus barbatus*. So clear view on classifying of this species may be considered as a bases for morphological compression of other members of this group, description of this species may facilitate describing other related species.

In addition, recently arises more critical view on morphological classifying of fish species or on some less studied genus. "Like many other Cyprinids the *Brbus* genus was long included in *Barbus*. It appears to be a very close relative of the typical barbels – which include that genus type species *Barbus barbatus*, and may well warrant inclusion in *Barbus*. Many modern authors prefer to consider it a subgenus instead. It is, moreover, not entirely clear what species to place in *Luciobarbus* if it is deemed valid. The IUCN argues for a rather inclusive circumscription. Non with standing the taxonomy and systematics of this ill-defined assemblage, their closest living relative is probably *Aulopyge huegelii*." [6].

### 1.1 The exist problem on *L. barbatus*

During the last decades *L. barbatus* has been reported and described for several times or has been synonymized with other related species.

According to Almaça, (1993), Günther (1868), based on Heckel's original description, Sauvage (1884) and Pellegrin (1923), based on specimens from the Orontes (Lake Homs, Hammah, and Antakya), Khalaf (1961) on specimens from Iraq, present descriptions of *L. barbatus*[10]. Berg (1949) based on Heckel's original description reported 4 specimens from Karun R. basin in Khuzistan Iran, [11] that apparently gathered by Zarudnyi in his travels throughout Iran in 1896, 1900-1901 and 1903-1904. [In original report the name of Arabistan is wrong, there is no place by name of Arabistan in Iran it is probably Khuzistan.][9]

Mahdi Nuri (1962) from Iraq reported *Luciobarbus barbatus* in Qezilja River (Leaser Zab)[12].

Saadati M.A. (1977) reported eight specimens from the tributaries of Saymareh and Tigris R.[13].

Valiallahi, (20000 in his PhD. Tesses on *Barbus* species of Iran states: "Despite the clear description of stated authors from 1970 arise some doubt about type locality and validity on *L. barbatus*. Also there was conflicting view on morphological character of this species" [14].

#### 1.1. 2 Systematics

Howes (1987) places this species in *Barbus sensu stricto*[15]. Almaça (1983)[16] placed *L. barbatus* as a subspecies of *Luciobarbus mystaceus* (Pallas, 1814) and synonym of *Labeobarbus orontis* Sauvage, (1882)( Krupp, F. 1985a)[17] .

Possibly syntype of *L. barbatus* (NMW 53957) was examined by Almaça (1986) He states that a probable syntype of *L. barbatus* (from Kara Agatsch, Iran) was found, but it is in so bad conditions that nothing can be recognised by its examination curiously, all the specimens which could be identified with *L. barbatus* original description proceed from the Mediterranean coast of Western Asia: Lake Tiberias (Israel), Orontes and Lake Homs (Syria), and Lake Antakya (Turkey). As *L. barbatus* was described from Iran there is here an intriguing geographical problem which can't be solved before more information be available. (Almaça 1983)[4,16]. Regarding similarity and overall morphology, Almaça realised that there is a close affinity between *L. barbatus* and group *bocagei* (Almaça 1984b, 1990). Later Almaça (1984a, 1984b, 1986, 1991) [4,9] retained *barbatus* as a full species known only from the Levant, despite Heckel's record from the Qarah Aqaj (= Mand) of Fars, Iran.(Coad, 2017)

Krupp (1985) places *Luciobarbus barbulus* in *Luciobarbus pectoralis* Heckel, 1843 and gives data on the disposition of the holotype of *Luciobarbus pectoralis* (in the Naturhistorisches Museum Wien under NMW 54474, 116 mm standard length, 1839, Th. Kotschy [17, 18, 19]. Karaman (1971) places this species in the synonymy of *Barbus rajanorum* but other authorities consider it to be *Luciobarbus pectoralis* (q.v.) [20].

According to Karaman (1971) *L. barbulus* would be synonym of *L. rajanorum* or subspecies of *L. rajanorum rajanorum* [21].

Coad states that the synonymy of *Luciobarbus barbulus* with *L. pectoralis* remains uncertain (Coad, 2017) [3]. The possibly syntype of *L. barbulus* (NMW 53957) also was seen by Dr. B.W. Coad (1997) he states that: it is in too poor condition to be of any value, being mostly bones. Coad state, another syntype is listed as NMW 6596 and measures 119.3 mm standard length. He continued that in 1997 this was the only syntype recognised. The catalogue in Vienna lists only 1 fish, while Heckel's description refers to several fish. NMW 6596 is mostly bones and is dried. The fleshy lip fold of the original description could not be discerned, teeth are missing and the dorsal fin is broken off short [3]. According to. Armantrout N.B (1981) *L. barbulus* and *L. longiceps* are very closed and probably the same species. [22]. According to Almaça (1983) *L. barbulus* is separated from *L. mystaceus* by having thinner lips, shorter barbels, the last unbranched dorsal ray weaker and shorter, more dense denticles spread over a shorter length of ray, higher anal fin, gill rakers less numerous and the upper dorsal profile is rectilinear and oblique to the back.

On the name of *L. barbulus*, Coad (1997) stated: I retain it as a species under Heckel's name for this taxon until the systematics of this and related species can be worked out [3].

## 2. Results

*Luciobarbus barbulus* (Heckel 1846) is valid species and differ from *L. mystaceus*, *L. scheich*, *L. kersin*, *L. pectoralis*, *L. rajanorum*. (see Heckel 1843, 1846, 1849b) [7, 23, 24]

Although there is high degree of overlap in some of meristic and morphometric characters but these taxa differ from each other. *L. barbulus* is not a subspecies of *Luciobarbus mystaceus* (Heckel 1846). This species differ from *L. mystaceus* in having thick and very wide fleshy lip, inferior mouth and slightly shorter head (fig. 1,2,4). In *Luciobarbus barbulus* the back adjoins with a slight bump directly to the posterior part of the head, so head is more inferior (fig. 1-6) but in *Luciobarbus mystaceus* with thinner lips pointed head, mouth is subterminal [2]. The body depth after dorsal fin in *Luciobarbus mystaceus* is thicker and the trunk join to caudal fin with more slope than in *Luciobarbus barbulus* [28].

In fingerling specimens, the dorsal fin length, head shape and body depth between these two species are more resemble, but in larger fish the proportion of body depth with dorsal in *L. mystaceus* is less, so body is thicker than in *L. barbulus*. and proportion of head length to body depth in *L. barbulus* is more than in *L. mystaceus*. (table 1.) In adult fish at same size *L. barbulus* have more cylindrical body but in *L. mystaceus* body depths is more wider. In small fish head of *L. barbulus* is smaller or equal in size with head of *Luciobarbus mystaceus* but in adult fish head in *L. barbulus* will grow more bigger than in *L. mystaceus* (fig.11).

The obvious features in first view separate these two species are as follow:

Exactly as Heckel (1849) state the lips of *Luciobarbus barbulus* are thick with wide fleshy lip fold which forms a small median lobe. The dorsal fin, is far less obliquely truncated and when folded back, hardly reaches the beginning of the anal fin." [7, 23, 24]. These fishes have more variable features and sometime abnormality in vertebra or in size of fins. There is probably hybrid between these fishes and other related species, but stated feature are more stable and *Luciobarbus barbulus* is a distinct species that retain it's shape from fingerling to a giant fish (fig.1-6, 11)

Resent record on present status of these species shows that, for now (2017) it may be caught from nearly all of the places or locality or stations that are mentioned at this paper sometimes with extensive effort per catch, or in some place simply by trapping net or rod and line angling. but because of habituate degradation, pollution and over expedition of water and damming at routes

for spawning, all of these valuable species are rare and their habitats are under threat, all of these species require précises protection. [25, 26, 27, 28, 29]. As our catch efforts indicate the stock of this species are declining from Azabayjan Ghabi, Mahabad, Kurdistan, Kernanshah, Ilam, Lorestan, Kosestan and Fars province.

The biology and population of these species need more investigation. Information on stock, biology and distribution of these species is inadequate. This fish could be one of best candidate for inland fishery and aquaculture development.

### 3. Discussion

To clarify, contradiction and suspicious on validity of *Luciobarbus barbatus* we have to refer on the original writing of Heckel (1846- 1849 b)[7]. When Heckel (1849) received 15 Persian fish species, were collected by Theodor Kotschy around Shiraz, he previously have described the Syrian fish species. Heckle's remarks on *L. barbatus* and *L. mystaceus* is clear and obvious, so that eliminate any doubt about differences between *Luciobarbus barbatus* and *Luciobarbus mystaceus*. He stated "the water systems around Shiraz yielded the ... 15 species. Considering *Luciobarbus barbatus*, Heckel (1849) states: "this species is distinguished from all other barbs of Syria by its very wide fleshy lip fold which forms a small median lobe below the symphysis of the lower jaw. This peculiarity reminds us of our *Luciobarbus mystaceus*, which it resembles remarkably in its entire appearance; however, the head is slightly shorter, the back adjoins with a slight protuberance directly to the posterior part of the head; the dorsal fin, which in *Luciobarbus mystaceus*, when folded back, reaches past the middle of the anal fin base, is here far less obliquely truncated; its height is only such that, when folded back, it hardly reaches the beginning of the anal fin." Heckel( 1849) stated that this fish inhabits the Kara-Agatsch River; our specimens are 7-8 inches long and were caught near the village of Gere".[7, 23, 24]

Heckel (1849) stated that: "We also have a few, 9 inch long individuals from the Kueik (Queik) near Aleppo which we had considered to be chance deviations of *Luciobarbus mystaceus* before we encountered the Persian specimens"[23]. When continued description of *L. barbatus* he stated that "but the most significant deviation [between two species] concerns the pharyngeal teeth of which there are five on the inner row, as in all barbs, but not four as in *Luciobarbus barbatus*." [24]

Considering pharyngeal teeth Almaça 1990, state: "actually, I only found 4 outer teeth in the specimens belonging to *L. mystaceus barbatus*, and 4 or 5 in *L. mystaceus mystaceus*" [9]

Contrary to Almaça 1990 stated remark, our examination shows, that pharyngeal teeth is not distinctive, stable or a good characters for separating these two species. In these two species and other related species, pharyngeal teeth is 2.3.4, rarely 1.3.4 and in some specimens is 2,3,5 or 1,3,5[9][30].

In conclusion according to Heckle,(1849) *Luciobarbus barbulus* is an species of Persia and is differ from *L. mysaceus* that were seen both from Shiraz, Iran and in the Kueik (Queik) near Aleppo in Syria.

### 3.1 Morphology

Among all *Barbus* and *Luciobarbus* species collected at western Iran and the specimen were examined in CMN, we carried out full analyses and measurement on 25 specimens.

The results are as follow and the measurement are summarised in Table 1:

The inferior mouth is moderate in size, lips are very thick and well developed, sometimes extraordinarily so; lower lip very broad, with a short lobule at symphysis. As stated by Heckel (1849) this species is distinguished from all other barbs of Iran and Syria by its very wide fleshy lip fold which forms a small median lobe below the symphysis of the lower jaw and, the back adjoins with a slight protuberance directly to the posterior part of the head (fig1 and 2). Barbells are relatively thick. Two pairs of barbells, The anterior barbell does not extend past the anterior eye margin level and the posterior one not past the posterior eye margin in all sizes of fish, rostral 1.3; maxillary 1.45 times the diameter of eye.

Head comprised 3.7 times in the standard length and including 2.6(2.2-3.1) times the snout and 8.5 times of the orbit. Standard length including 4.4 (3.8-5.3) times the body depth. Dorsal fin with 4 unbranched 7-9, average of 8, branched rays, Anal fin with 3 unbranched and range of 6-9 average of 7 branched rays. Upper profile of the dorsal fin rectilinear, slightly concave, and oblique. Last unbranched ray of the dorsal fin and denticles of its rear edge strong. Denticles long and spread over the 9/10 of the depth of the ray. In older fishes the last unbranched ray contains 36 denticles and in younger 23. Average 29 range 22-36 denticles. when the dorsal fin is pushed back its tip, will not reach or extends scarcely to the origin of anal fin. Origin of the dorsal fin at the same level or slightly forward the origin of the ventral fin.

Pectoral fin branched rays 11-20(average 16), ventral fin branched rays 7-10, average 8. Lateral line scales 52-58, average of 54, S.D. 1.7, mode 55. Above lateral line range 8-13 average 10 below lateral line 7-9 average 7, (see table 1).

Dorsal fin length and proportion of standard length with body depth and head length are important character for *Luciobarbus barbulus* and other related species, in this species dorsal fin height among 25 specimens with total length of 108-610 average of 298 cm is between 22-100 mm, average of 52 mostly 56. (With body Weight from 12 to 2100 g and average of 349.1 g). Gill rakers, 17-24, average 20. Pharyngeal teeth mostly compressed, otherwise with pointed tip, mostly 4-3-2. The fifth tooth very small and rounded and sometimes absent apparently independent of size.

Considering the size of fishes lives at the Zagross mountain basin rivers, after *L. esocinus*, *L. barbulus* is the second large *Barbus* species, that will attain size of some 1.5 m, with a weight of about 90 kg or more.

### 3.2 Colour

The back and upper flank are dark greyish. The lower flank and the belly whitish. Upper flank scales are outlined with pigment, and the anterior edge of the dorsal fin and the caudal fin margin are yellow bright red in fresh fish specimens. The colour in different locality is slightly different and mostly is uniform. The back is dark greyish and the lower part of body whitish. The overall colour is silvery and the anal and caudal fin lobe sometimes are bright red. The dorsal fin is grey and the pectoral and pelvic fins yellowish to bright red. The peritoneum is black.

### 3.3 Similarity and Local and Common names:

Overall morphology points to a close affinity between *L. mystaceus*, *L. scheich*, *L. rajanorum*, *L. belayewi*. Although there are several arabic and local names for these species but apparently local fisherman do not distinguish differences between all individual of these group, in Kermanshah province local fisherman called these group by name of **Dolenj**.

lab pahn (= broad lip), برزم (berzem or barzam); berzem lab pahn in Khuzestan and Iraq to distinguish it from *Luciobarbus pectoralis*; boz mahi (= goat fish) or سس ماهی (= SAS mahi in the Dalaki and Shapur River basins)[3]

Arabic name is *Abu-Barattum*. (Mahdi 1962). *Abu-Baratem*, *Nabbash*[10]. At Laser ZAB in Iran, Peerdanan Station, name of this species at Peranshaher, Mahabad, is PollKey Lowt KoVer, پولكهی لوتكوور (= curved head and snout.) Mahi Lab Gholveei (= broad lip)[25].

#### 4. Materials and Methods

##### *Luciobarbus barbulus*:

All specimen with CMN signs are museum specimens that are keep at Canadian Museum of Nature, they have catalog number or Tag in corner of fish mouth or any number such as 131(231). J.V.C is abbreviation for Jalal Valiollahi Collection, refer to specimen's collected By J. Valiollahi et.al. from Iran during 1985 to 2015.

Among these 34 specimens preserved in CMN only 7 specimens recognized as *Luciobarbus barbulus*, , 4 specimens are aberrant specimens ,which have disorder in body shape, variable number of vertebra or exhibited characters intermediate between two more related species.

Calculating for morphometric and meristic characters for *Luciobarbus barbulus* was carried out on specimens in CMN and 18 specimens among J.V.C.

(1) Catalog number CMN 93-0153, 280 mm TL, 230, SL ♀ Khuzestan-Zohreh R. collector; I. Sharifpour, 1991.

(2,3,4) CMN, 131(231).[small ,108mmTL,87mmSL; medium,112mm TL,90 mm SL; big 160 mm TL, 140 mm SL, ♀ 4.3.2 PT; Kordestan - Qeshlaq R. south of Sanandaj, 35/16 N 47/01 E ;Coad 1976.

(5) CMN Tag- M 2188; 223 mm TL 178 mm SL,♀, Kermanshah, Gamasiab R. Qharah Su or GHARAH SO 34 10 N 47 21 E, Jalal Vaiallahi ,28 Apr. 1997-8.

(6)CMN 88-0148; 236mm TL,194mm SL. Turkey, Elazig, Keban dam,on Euphrates, 38 48 N,38 45 E, Sarieyyüpoğlu 1987;

(7)CMN, Shiraz, Noor Abad-Garab 2001; 195mm, TL; 159mm SL, ♂

(8) J.V.C GM-76, 301 mm TL, 237 mm SL, Gamasiab River 1997.

(9)J.V.C J-7, 295mmTL,250mm SL, Gamasiab-Garous1999, 38 18 N 46 02 E.

(10) J.V.C J-6, 304mm TL, 244 mm SL, Sirvan R.-1999

(11) J.V.C 610 Alvand , 610 mm TL, 500 mm SL, Alvand R. 1999 34 /18 N 45 /11E

(12) J.V.C 50 Sirvan, 610 mm TL,505 mm SL, Sirvan-Daryan2000

(13) J.V.C 29/6, 283 mm TL, 225 mm SL, Garrous, Gamasiab River 1999- 38 /18 N 46 / 02

(14) J.V.C GM-80, 375 mm TL, 295 SL, Gamasiab -1999

(15) J.V.C 16687, 373 TL, 297 SL, Gamasiab R. Lived for 2 month in aquarium 1998.

(16) J.V.C 273Garrous , 273 mm TL, 237 SL , Gamasiab-Garrous 1999- 38 /18 N 46 / 02

(17) J.V.C CH-3, 166 mm TL, 145 mm SL, Gamasiab River-2000

(18) J.V.C 222, 225 mm TL, 183 mm SL, Sirvan-Shakhan-1999

(19)J.V.C 1669; 237mm TL, 196 mm SL, Zimkan R.-1999

(20)J.V.C J-3, 290 mm TL, 239 mm SL, Sarab Nilofar

(21)J.V.C GM-77, 296 mm TL,247 mm SL, Gamasiab-1999;

(22)J.V.CGarruos,325mm TL,270 mm SL. Lived for 2 month in aquarium;

(23)J.V.C Rika 2000, 327mm TL,271 mm SL, Rika, Ravansar, 34 43 N 46 40 E 2000

(24)J.V.C, GM- 79, 340mm TL, 286 mm SL, Gamasiab-1999.

(25)J.V.C GH-34, 370 mm TL,305 SL, Gamasiab R. 2000.

Aberrant and anomalous specimens:

CMN 132(232); 241 mm,193 mm,♀, Kurdistan, Yuzidar R1976, B.W.Coad, 1976;

CMN 133(233), 190 mm, 150 mm; Sar-pol-e-Zuohab, 34-36- N; 45-56-E;

CMN 139(239) medium one, 160mm TL, 137 mm SL, see no. (17) below.

CMN Tag 2187, Kermanshah, Gharaso R. J. Valiollahi, 1997

Comparative material

For comparing measurement carried out on 26 specimens that were distinguished as *L. mystacius* 24 specimen imperfectly haven named as *L. b* and 2 specimen as *Luciobarbus pectoralis*, these specimens are:

CMN 91-0154 big one, 340 mm TL. 280 mm SL; Hour-Al-Azim; Sep. 1991.

CMN, 91-0154, small one, 330 mm TL, 265 mm SL. Same locality and collector as big one. Also comparative material were 4 specimens of *Barbus longiceps* Valenciennes, (1842), with catalog number of 80-0835, from Israel, Lake of Galilee, Jul 1981. With 187 – 286 mm TL length, 154-229 mm SL.

## 5. Conclusions

Resent record on present status of these species shows that, because of habituate degradation, pollution and over expedition of water, all of these species are rare and their habitats are under threat, all of these species require protection. [25, 26, 27, 28, 29]

The biology and population numbers of these species need more investigation. Information on stock, biology, distribution of these species is scarce and just a few information, because of misidentifying species, or confusing them with other related species may not be scientifically valid. We hope the shape and record documented in this paper would be useful for identifying this defined species from other related species. This fish could be one of best candidate for Inland water Aquaculture Development.

**6. Acknowledgments:** Part of this paper is from the corresponding author PhD. Theses carried out at Tarbiat Modares University and Canadian Museum of Nature. We are grateful to the staff of this great museum and Dear Amin Kayvan for his help and encouragement, and hope. ( is no more among us, God blessed his soul). The study on newly caught species was funded by Iran National Science Foundation (INSF), project No. 91001954. The authors thank the colleagues at this institute. Then more grateful to all of our Iranian friends in Ministry of Agriculture the department of Fishery and Aquaculture of Kermanshah; Mohamad Ghazi, Shahmahmodi S.; Bidel R.; Haidary B. We would like thank Members of the Board of Directors of Scientific Aassociation of Environmental Education and Sustainable development EESD [www.eesd.ir](http://www.eesd.ir) for ethical approval of performing the project and monitoring its implementation process in accordance to the laws and regulations of IUCN in the treatment to animals. This project approved in Shahid Rajaei Teacher Training University, so it is our duty thanks all of the staff of these institution.

**7. Author Contributions:** For this research articles Valiollahi J. wrote the paper, comprehended and designed the experiments; performed the experiments; analyzed the data; Dr. Coad Brian W. contributed reagents/materials/analysis tools and supervised the PhD. Theses, ethnically edited and revised draft manuscript advise and has given critical suggestions"

**8. Conflicts of Interest:** "The authors declare no conflict of interest." Authors identify and declare that: are ready for give explanation to any personal circumstances or interest that may be perceived as inappropriately influencing the representation or interpretation of reported research results; any role of the funding sponsors in the design of the study; in the collection, analyses or interpretation of data; in the writing of the manuscript, or in the decision to publish the results. "The founding sponsors had no role in the design of the study; in the collection, analyses, or interpretation of data; in the writing of the manuscript, and in the decision to publish the results".
