SERIES REPRESENTATION OF POWER FUNCTION

KOLOSOV PETRO

Abstract. In this paper described numerical expansion of natural-valued power function \( x^n \), in point \( x = x_0 \) where \( n, x_0 \) - natural numbers. Applying numerical methods, that is calculus of finite differences, namely, discrete case of Binomial expansion is reached. Received results were compared with solutions according to Newton’s Binomial theorem and MacMillan Double Binomial sum. Additionally, in section 4 exponential function’s \( e^x \) representation is shown.

Keywords. power function; binomial coefficient; binomial theorem; finite difference; perfect cube; exponential function; pascal’s triangle; series representation; binomial sum; multinomial theorem; multinomial coefficient; binomial distribution

Contents

1. Introduction and Main Results

In this paper coefficient \( \binom{n}{k} \) is introduced and its properties are shown, one of which is power’s expansion. We will generalize the partial case of power \( n = 3 \), received using \( \binom{n}{k} \) to high power \( u > 3 \). First, let basically describe Newton’s Binomial Theorem, since our coefficient \( \binom{n}{k} \) is derived from finite difference of perfect cubes, which is taken regarding Binomial expansion. In elementary algebra, the Binomial theorem describes the algebraic expansion of powers of a binomial. The theorem describes expanding of the power of \( (x + y)^n \) into a sum involving terms of the form \( ax^by^c \) where the exponents \( b \) and \( c \) are nonnegative integers with \( b + c = n \), and the coefficient \( a \) of each term is a specific positive integer depending on \( n \) and \( b \). The coefficient \( a \) in the term of \( ax^by^c \) is known as the Binomial coefficient. The main properties of the Binomial Theorem are next

Properties 1.1. Binomial Theorem properties

1. The powers of \( x \) go down until it reaches \( x_0 = 1 \) starting value is \( n \) (the \( n \) in \( (x + y)^n \))
2. The powers of \( y \) go up from 0 (\( y^0 = 1 \)) until it reaches \( n \) (also \( n \) in \( (x + y)^n \))
3. The \( n \)-th row of the Pascal’s Triangle (see [?], [?]) will be the coefficients of the expanded binomial.

Date: November 24, 2017.
(4) For each line, the number of products (i.e. the sum of the coefficients) is equal to \( x + 1 \)

(5) For each line, the number of product groups is equal to \( 2^n \)

According to the Binomial theorem, it is possible to expand any power of \( x + y \) into a sum of the form (see [?], [?])

\[
(x + y)^n = \sum_{k=0}^{n} \binom{n}{k} x^{n-k} y^k
\]

Let expand monomial \( x^n \) such that \( (x, n) \in \mathbb{N} \) applying finite differences, that are reached by means of Binomial theorem (1.2)

**Lemma 1.3.** Power function could be represented as discrete integral of its first order finite difference

\[
x^n = \int_0^x \Delta_h[x^n] h
\]

\[
= \sum_{k=0}^{x-1} nk^{n-1}h + \binom{n}{2} k^{n-2}h^2 + \cdots + \binom{n}{n-1} kh^{n-1} + h^n
\]

\[
= \sum_{j=0}^{x-1} \sum_{k=1}^{j} \binom{n}{k} j^{n-k}h^k, \ h \in \mathbb{R}
\]

We can reach the same result using Fundamental Theorem of Calculus

\[
x^n = \int_0^x nt^{n-1} dt = \sum_{k=0}^{x-1} \int_k^{k+1} nt^{n-1} dt = \sum_{k=0}^{x-1} (k+1)^n - k^n
\]

**Lemma 1.6.** From lemma (1.4) follows that finite difference of power \( x^n, n \in \mathbb{N} \) could be reached by Binomial expansion of the form

\[
\Delta_h[x^n] = (x + h)^n - x^n = \sum_{k=1}^{n} \binom{n}{k} x^{n-k} h^k
\]

Otherwise, let be a difference table of perfect cubes (see also [?], eq. 7) \( \Delta^k[x^3], x \in \mathbb{N}, k \in [1, 3] \subseteq \mathbb{N} \) over \( x \) from \( [0, 7] \subseteq \mathbb{N} \)

\[
\begin{array}{cccc}
  x & x^3 & \Delta[x^3] & \Delta^2[x^3] & \Delta^3[x^3] \\
  0 & 0 & 1 & 6 & 6 \\
  1 & 1 & 7 & 12 & 6 \\
  2 & 8 & 19 & 24 & 6 \\
  3 & 27 & 37 & 24 & 6 \\
  4 & 64 & 61 & 30 & 6 \\
  5 & 125 & 91 & 36 & 6 \\
  6 & 216 & 127 &  &  \\
  7 & 343 &  &  & \\
\end{array}
\]

Figure 1: Difference table of \( x^3, x \in \mathbb{N} \) up to 3rd order, [?], eq. 7
Note that increment $h$ is set to be $h = 1$ and $k > 2$-order difference is taken regarding to [7]. From Figure 1 the regularity concerning sequence A008458 [7] in OEIS is observed, [7], that is the first order finite difference of consequent perfect cubes equals to $1 + a(n)$, where $a(n)$ is generating function of sequence A008458.

Let show, that

\[ \Delta_{h=1}[x^3] = (x + 1)^3 - x^3 = 1 + 3! \cdot 0 + 3! \cdot 1 + \cdots + 3! \cdot x \]  

Applying compact sigma notation on (1.9), by means of identities,

\[ \Delta_{h=1}[x^3] = 1 + 3! \cdot 1 + 3! \cdot 2 + \cdots + 3! \cdot x \]
\[ \nabla_{h=1}[x^3] = 1 + 3! \cdot 0 + 3! \cdot 1 + \cdots + 3! \cdot (x - 1) \]

the first order forward, as well as backward finite difference of consequent perfect cubes could be represented as

\[ \Delta_{h=1}[x^3] = \sum_{k=1}^{x} 3! \cdot k + \frac{1}{x} = 3! \left( \frac{x+1}{2} \right) + 1 \]
\[ = \sum_{k=1}^{x} 3! \left( \frac{k}{k-1} \right) + \frac{1}{x}, \quad x = x_0 \in \mathbb{N}, \ x \neq 0 \]
\[ \nabla_{h=1}[x^3] = \sum_{k=0}^{x-1} 3! \cdot k + \frac{1}{x} \]
\[ = \sum_{k=0}^{x-1} 3! \left( \frac{k}{k-1} \right) + \frac{1}{x}, \quad x = x_0 \in \mathbb{N}, \ x \neq 0 \]

By lemma (1.3) discrete integral of first difference is used to reach expansion of monomial $x^n$, $h \in \mathbb{R}$ and we have an equality between (1.7) and (1.11)

\[ \Delta_{h=1}[x^3] = \sum_{k=1}^{3} \binom{3}{k} x^{3-k} = \sum_{k=1}^{x} 3! \cdot k + \frac{1}{x}, \quad x = x_0 \in \mathbb{N}, \ x \neq 0 \]

Then we have right to substitute (1.11) into (1.4) instead binomial expansion and represent perfect cube $x^3$ as summation over $k$ from 0 to $x - 1$. Let be extended example of expansion of $x^3$, $x \in \mathbb{N}$

\[ x^3 = (1 + 3! \cdot 0) + (1 + 3! \cdot 0 + 3! \cdot 1) + (1 + 3! \cdot 0 + 3! \cdot 1 + 3! \cdot 2) + \cdots + (1 + 3! \cdot 0 + 3! \cdot 1 + 3! \cdot 2 + \cdots + 3! \cdot (x - 1)) \]
\[ = x + (x - 0) \cdot 3! \cdot 0 + (x - 1) \cdot 3! \cdot 1 + (x - 2) \cdot 3! \cdot 2 + \cdots + (x - (x - 1)) \cdot 3! \cdot (x - 1) \]
Provided that $x$ is natural. Note that increment $h$ in equation (1.14) is set to be $h = 1$ and not displayed. Using compact sigma notation on (1.14), we received

\begin{equation}
(1.15) \quad x^3 = x + 3! \cdot \sum_{m=0}^{x-1} mx - m^2 = x + 3! \cdot \sum_{m=0}^{x} mx - m^2 \\
= x + 3! \cdot \sum_{m=1}^{x} mx - m^2 = \sum_{m=0}^{x-1} 3! \cdot mx - 3! \cdot m^2 + 1 \\
= \sum_{m=1}^{x} 3! \cdot mx - 3! \cdot m^2 + 1, \quad x \in \mathbb{N}, \ n \in \mathbb{N}
\end{equation}

**Property 1.16.** Let be a sets $S(x) := \{1, 2, \ldots, x\} \subseteq \mathbb{N}$, $C(x) := \{0, 1, \ldots, x-1\} \subseteq \mathbb{N}$, $U(x) := \{0, 1, \ldots, x-1\} \subseteq \mathbb{N}$, let be right part of (1.15) written as

\begin{equation}
T(x, U(x)) := \sum_{m \in U(x)} 3! \cdot mx - 3! \cdot m^2 + 1
\end{equation}

where $x \in \mathbb{N}$ is variable and $U(x)$ is iteration set of (1.15), then we have equality

\begin{equation}
T(x, U(x)) = T(x, S(x)), \quad x \in \mathbb{N}
\end{equation}

Let be central part of (1.15) denoted as

\begin{equation}
U(x, C(x)) := x + 3! \cdot \sum_{m \in C(x)} mx - m^2,
\end{equation}

then

\begin{equation}
U(x, C(x)) = U(x, S(x)) = U(x, U(x))
\end{equation}

Other words, change of iteration sets of central and right parts of (1.15) by $C(x), S(x), U(x)$ and $U(x), S(x)$ respectively, doesn’t change resulting value of (1.15) given $x \in \mathbb{N}$.

**Proof.** Let be a plot of $y = 3! \cdot kx - 3! \cdot k^2 + 1$ by $k$ over $\mathbb{R}_{\leq 10}^+$, given $x = 10$

![Figure 2. Plot of $y = 3! \cdot kx - 3! \cdot k^2 + 1$ by $k$ over $\mathbb{R}_{\leq 10}^+$, given $x = 10$](image-url)
Obviously, being a parabolic function, it’s symmetrical over $\frac{x}{2}$, hence equivalent $T(x, \ U(x)) = T(x, \ S(x))$, $x \in \mathbb{N}$ follows. Reviewing central part of (1.15) and denote $u(t) = tx^{n-2} - t^2x^{n-3}$, we can conclude, that $u(0) = u(x)$, then equality of $U(x, \ C(x)) = U(x, \ S(x)) = U(x, \ U(x))$ immediately follows.

This completes the proof. $\square$

Note that for right part of (1.15) property (1.16) holds only in case (1.17). Let analyse property (1.16). Let be an example of triangle\footnote{Note that each $x = 0, 1, 2, 3, \ldots$, $N$ row’s item of triangle is generated by $3! \cdot kx - 3! \cdot k^2 + 1$ over $k \in [0, x] \subseteq \mathbb{N}$} built using right part of expression (1.15) over $x$ from 0 up to $x = 4$. We can see that for each row corresponded to variable $x = 0, 1, 2, 3, 4, \ldots$, we have Binomial distribution of row items, more detailed

$$
\begin{array}{ccc}
1 & 1 & 1 \\
1 & 7 & 1 \\
1 & 13 & 13 & 1 \\
1 & 19 & 25 & 19 & 1 \\
\end{array}
$$

Figure 3. Triangle generated by $3! \cdot kx - 3! \cdot k^2 + 1$, that is right part of (1.15) from 0 up $x = 4$ over $k$ from 0 to $x$, sequence $\text{A287326}$ in $\text{OEIS}$.

One could compare Figure (1.19) with Pascal’s triangle\footnote{Note that each $n = 4$ over $k$ from 0 to $n$, sequence $\text{A007318}$ in $\text{OEIS}$.}$\text{A007318}$ in $\text{OEIS}$.

Review the triangle (1.19), define the $k$-th, $0 \leq k \leq n$, item of $n$-th row of triangle as

**Definition 1.20.**

\begin{equation}
\left[ \begin{array}{c}
1 \\
1 \\
1 \\
1 \\
\end{array} \right] := 3! \cdot nk - 3! \cdot k^2 + 1, \ 0 \leq k \leq n
\end{equation}

Note that definition (1.20) also could be rewritten as

\begin{equation}
\left[ \begin{array}{c}
1 \\
1 \\
1 \\
1 \\
\end{array} \right] = 3! \cdot nk - 3! \cdot n^0 k^2 + n^0, \ 0 \leq k \leq n
\end{equation}

Let us approach to show a few properties of triangle (1.19)

**Properties 1.23.** Properties of triangle (1.19). For each $(n, m) \in \mathbb{N}$ holds
1. Summation of items $\nchoose k n$ of n-th row of triangle (1.19) over k from 0 to $n-1$ returns perfect cube $n^3$ as binomial of the form

\[
\sum_{k=0}^{n-1} \nchoose k n = A_{0,n} - B_{0,n} = n^3,
\]

Since the property (1.17) holds, (1.24) could be rewritten as

\[
\sum_{k=1}^{n} \nchoose k n = A_{1,n} - B_{1,n} = n^3,
\]

where $A_{\text{tri},n}$ and $B_{\text{tri},n}$ - integers depending on variable $n \in \mathbb{N}$ and on sets $\mathcal{U}(n), \mathcal{S}(n)$, respectively.

2. Recurrence relation between $A_{0,n}$ and $A_{1,n}$

\[
A_{0,n+1} = A_{1,n}, \quad n \geq 1
\]

(3) Induction by power. Summation of items of n-th row of triangle (1.19), multiplied by $n^{m-3}$, from 0 to $n-1$ returns $n^m$

(4) Summation of items $\nchoose k n$ of n-th row of triangle (1.19) over k from 0 to n returns $n^3 + n^0$

\[
\sum_{k=0}^{n} \nchoose k n = n^3 + 1
\]

5. Induction by power. Summation of each n-th row of triangle (1.19) multiplied by $n^{m-3}$ from 0 to n returns $n^m + n^{m-3}

6. First item of each row's number corresponding to central polygonal numbers sequence $a(n)$ (sequence $[A000124]$ in OEIS, [?], [?]) returns finite difference $\Delta[n^3]$ of consequent perfect cubes. For example, let be the k-th row of triangle (1.19), such that $k$ is central polygonal number, i.e $k = \frac{n^2 + n + 2}{2}$, $n = 0, 1, 2,..., \mathbb{N}$, then item

\[
\nchoose n^2+n+2 1 = \Delta_h[n^3], \quad h = 1
\]

(7) Items of (1.19) have Binomial distribution over rows

(8) Triangle (1.19) being arranged as right triangle has the k-th column generating formula $x^k \cdot (1 + (6 \cdot k - 1) \cdot x)/(1 - x)^2$, [?].

(9) The linear recurrence, for any k and $n > 0$

\[
2 \nchoose n k = \nchoose n+1 k + \nchoose n-1 k
\]

10. Linear recurrence, for each $n > k$

\[
2 \nchoose n k = \nchoose 2n - k k + \nchoose 2n - k 0
\]

(11) From (1.27) follows that

\[
\sum_{k=0}^{n-1} \nchoose k n = \sum_{k=0}^{n-1} \nchoose k^2+k+2 1
\]
SERIES REPRESENTATION OF POWER FUNCTION

In (1.24) is noticed, that summation of each $n$-th row of Triangle (1.19) from 0 to $n - 1$ returns perfect cube $n^3$, then, by properties (1.27), (1.28), (1.29), for each given number $x \in \mathbb{N}$ the $x^n$ could be easy found via multiplication of each term of (1.24) by $x^{n-3}$

\[
(1.31) \quad x^n = \sum_{k=0}^{x-1} \binom{x}{k} x^{n-3} = \frac{1}{2} \sum_{k=0}^{x-1} \left[ \left\lfloor \frac{x+1}{k} \right\rfloor + \left\lfloor \frac{x-1}{k} \right\rfloor \right] x^{n-3}
\]

\[
= \sum_{k=0}^{x-1} \frac{1}{2} \left[ \left\lfloor \frac{2x-k}{k} \right\rfloor + \left\lfloor \frac{2x-k}{0} \right\rfloor \right] x^{n-3}
\]

\[
= \sum_{k=0}^{x-1} \frac{1}{2} \left[ \left\lfloor \frac{x+2k}{1} \right\rfloor + \left\lfloor \frac{x+2k}{2} \right\rfloor \right] x^{n-3} = \sum_{k=0}^{x-1} \frac{1}{2} \left[ \left\lfloor \frac{x^2+k}{2} \right\rfloor + \left\lfloor \frac{x^2+k}{1} \right\rfloor \right] x^{n-3}
\]

\[
= \sum_{k=0}^{x-1} \frac{1}{2} \left[ \left\lfloor \frac{(n+1)^2}{1} \right\rfloor + \left\lfloor \frac{(n+1)^2}{2} \right\rfloor \right] x^{n-3}
\]

To show other way of representation of power, let move the $x$ from (1.15), $x + 3! \sum m x - m^2$, under the sum operator and change iteration set from $\{0, x - 1\}$ to $\{1, 1-x\}$, then we get

\[
(1.32) \quad x^3 = \sum_{m=1}^{x-1} 3! \cdot m x - 3! m^2 + \frac{x}{(x-1)}, \quad x \neq 1, x \in \mathbb{N}
\]

Review right part of (1.32), let be item $\frac{x}{(x-1)}$ written as $\frac{x+1}{x-1} = 1 + \frac{1}{x-1}$, given the power $n > 3$, multiplying each term of (1.32) by $x^{n-3}$ we can observe that

\[
(1.33) \quad x^n - 1 = \sum_{m=1}^{x-1} \left\lfloor \frac{x}{m} \right\rfloor x^{n-3} + x^{n-4} + x^{n-5} + \ldots + x + 1
\]

Applying properties (1.27), (1.29), (1.30), we can rewrite (1.22) as

\[
(1.34) \quad x^n - 1 = \sum_{k=1}^{x-1} \frac{1}{2} \left[ \left\lfloor \frac{2x-k}{k} \right\rfloor + \left\lfloor \frac{2x-k}{0} \right\rfloor \right] x^{n-3} + x^{n-4} + \ldots + x + 1
\]

\[
= \sum_{k=1}^{x-1} \frac{1}{2} \left[ \left\lfloor \frac{x+1}{k} \right\rfloor + \left\lfloor \frac{x-1}{k} \right\rfloor \right] x^{n-3} + x^{n-4} + \ldots + x + 1
\]

\[
= \sum_{k=0}^{x-1} \frac{1}{2} \left[ \left\lfloor \frac{m^2+m}{2} \right\rfloor + \left\lfloor \frac{m^2+m+4}{2} \right\rfloor \right] x^{n-3} + x^{n-4} + \ldots + x + 1
\]

\[
= \sum_{k=1}^{x-1} \left\lfloor \frac{k^2+k+2}{2} \right\rfloor x^{n-3} + x^{n-4} + \ldots + x + 1
\]

Moving 1 from left part of (1.33) under sum operator, we add a term $\frac{1}{x-1}$ to initial function $\left\lfloor \frac{x}{m} \right\rfloor x^{n-3} + x^{n-4} + x^{n-5} + \ldots + x + 1$. By means of expansion $\frac{1}{x-1} = 1 + x + x^2 + x^3 + \ldots$, the (1.33) could be rewritten accordingly

\[
(1.35) \quad x^n = \sum_{m=1}^{x-1} \left\lfloor \frac{x}{m} \right\rfloor x^{n-3} + x^{n-4} + \ldots + x + 1 - 1 - x^2 - x^3 - \ldots
\]
Generalizing (1.35) we have

\[(1.36)\]
\[x^n = \sum_{m=1}^{x-1} \left\lfloor \left\lfloor \frac{m^2 + m + 2}{1} \right\rfloor - 1 \right\rfloor x^{n-3} - x^{n-2} - x^{n-1} - \ldots\]

A product generalization of even and odd power for each \(x \in \mathbb{N}\), in case we define \(\left\lceil \frac{n}{k} \right\rceil\) as (1.22)

\[(1.37)\]
\[x^n = \begin{cases} \prod_{i=0}^{j-1} \left\lfloor \frac{x^0}{k} \right\rfloor, & n = 2j, \quad j > 0, \quad n \in \mathbb{N} \\ \prod_{i=0}^{j-1} \left\lfloor \frac{x^0}{k} \right\rfloor x^1, & n = 2j + 1, \quad j > 0, \quad n \in \mathbb{N} \end{cases}\]

1.1. Binomial Theorem based on definition (1.20). Let be two positive integers \(x, y\) raised to power \(n \in \mathbb{N}\), then, using definition 1.20, we receive

\[(1.38)\]
\[(x + y)^n = \sum_{k=0}^{x+y-1} \sum_{j=0}^{n-3} \left\lfloor \frac{x+y}{k} \right\rfloor \left( \begin{array}{c} n-3 \\ j \end{array} \right) x^{n-3-j} y^j \]
\[= \frac{1}{2} \sum_{k=0}^{x+y-1} \sum_{j=0}^{n-3} \left\lfloor \frac{2(x+y) - k}{k} \right\rfloor \left( \begin{array}{c} n-3 \\ j \end{array} \right) x^{n-3-j} y^j \]
\[= \frac{1}{2} \sum_{k=0}^{x+y-1} \sum_{j=0}^{n-3} \left\lfloor \frac{k^2 + k + 4}{2} \right\rfloor \left( \begin{array}{c} n-3 \\ j \end{array} \right) x^{n-3-j} y^j \]
\[= \frac{1}{2} \sum_{k=0}^{x+y-1} \sum_{j=0}^{n-3} \left\lfloor \frac{k^2 + k + 4}{2} \right\rfloor \left( \begin{array}{c} n-3 \\ j \end{array} \right) x^{n-3-j} y^j \]

Mathematica code of above expression is attached in Application 1.

1.2. Multinomial case for \(n = 4\). For each \(u, j, \ldots, m \in \mathbb{N}\) and \(n = 4\) holds

\[(u + j + \cdots + m)^4 = \sum_{k=0}^{u+j+\cdots+m-1} \left\lfloor \frac{u+j+\cdots+m}{k} \right\rfloor u + \left\lfloor \frac{u+j+\cdots+m}{k} \right\rfloor j + \cdots + \left\lfloor \frac{u+j+\cdots+m}{k} \right\rfloor m\]
1.3. Generalized Multinomial Theorem based on definition (1.20). Expression (1.21) could be generalized accordingly

\[
(1.39) \quad (u + j + \cdots + m)^n
\]

\[
= \sum_{v=0}^{u+j+\cdots+m-1} \sum_{k_u+k_j+\cdots+k_m=n-4} \binom{n-4}{k_u,k_j,\ldots,k_m} \left[ u + j + \cdots + m \right] v
\]

\[
+ \sum_{k_u+k_j+\cdots+k_m=n-4} \binom{n-4}{k_u,k_j,\ldots,k_m} \left[ u + j + \cdots + m \right] v
\]

\[
\cdots + \sum_{k_u+k_j+\cdots+k_m=n-4} \binom{n-4}{k_u,k_j,\ldots,k_m} \left[ u + j + \cdots + m \right] v
\]

where

\[
(1.40) \quad \binom{n}{k_u,k_j,\ldots,k_m} = \frac{n!}{k_u!k_j!\cdots k_m!}
\]

is multinomial coefficient.

1.4. Generalized Binomial Series by means of properties (1.24), (1.25). Reviewing properties (1.24), (1.25) we can say that

\[
(1.41) \quad x^n = A_{0,1,x} x^{n-2} - B_{0,1,x} x^{n-3}, \quad x = x_0 \in \mathbb{N}
\]

Rewrite the right part of (1.42) regarding to itself as recursion

\[
(1.42) x^n = A_{0,1,x} (A_{0,1,x} x^{n-4} - B_{0,1,x} x^{n-5}) - B_{0,1,x} (A_{0,1,x} x^{n-5} - B_{0,1,x} x^{n-6})
\]

\[
= A_{0,1,x}^2 x^{n-4} - 2A_{0,1,x} B_{0,1,x} x^{n-5} + B_{0,1,x}^2 x^{n-6}
\]

Reviewing (1.43) we can observe binomial coefficients before each \(A_{0,1,x} \), \(B_{0,1,x}\). Continuous \(j\)-times recursion of right part of (1.42) gives us

\[
(1.43) \quad x^n = \sum_{k=0}^{j} (-1)^k \binom{j}{k} A_{0,1,x}^{j-k} B_{0,1,x}^k x^{n-2j-k}
\]

Suppose that we want to repeat action (1.43) infinite-many times, then

\[
x^n = \binom{j}{0} A_{0,1,x}^j B_{0,1,x}^0 x^{n-2j} - \binom{j}{1} A_{0,1,x}^{j-1} B_{0,1,x}^1 x^{n-2j-1} + \cdots
\]

\[
+ \binom{j}{2} A_{0,1,x}^{j-2} B_{0,1,x}^2 x^{n-2j-2} - \cdots + \sum_{k=0}^{\infty} (-1)^k \binom{j}{k} A_{0,1,x}^{j-k} B_{0,1,x}^k x^{n-2j-k} + \cdots
\]

We know the solutions of above equation (1.42) for all \(A_{0,1,x}, B_{0,1,x}\) that present in follow table. The table arranged next way

\hline
\end{array}
\]

Table 1. Array of coefficients \( A_{0,1,x}, B_{0,1,x} \) over \( x \) from 1 to 10.

Sequence \( B_{1,x} \) is generated by \( 2x^3 + 3x^2, \ x \in \mathbb{N} \), sequence \([A275709](http://oeis.org/A275709)\) in OEIS, [?].

Sequence \( A_{1,x} \) is generated by \( 3x^2 + 3x, \ x \in \mathbb{N} \), sequence \([A028896](http://oeis.org/A028896)\) in OEIS, [?].

1.5. Comparison of (1.31) to Binomial Theorem and MacMillan Double Binomial sum. In this subsection let compare (1.31) to Binomial Theorem and MacMillan Double Binomial sum \(^2\)(see [?], eq. 12) hereby follow changes hold

1. While expansion is taken by Binomial theorem or MacMillan Double Binomial sum, the summation (1.2) is done over \( k = 0, 1, 2..., \mathbb{N} \) from 0 and 1 to \( n \), respectively, where \( n \in \mathbb{N} \) - power. Reviewing (1.31) we can observe that summation is taken over \( k \) from 0 to \( x \), where \( x \) - variable, provided that natural-valued.

2. According to property (1.16) the iteration sets of right and central parts (1.15) could be changed to (1.17), (1.18) without changes in result.

3. We observed that expansion (1.31) returns the power of each particular number \( x \in \mathbb{N} \) as binomial of the form

\[
A_{0,1,x}x^{n-2} - B_{0,1,x}x^{n-3},
\]

which holds in particular case \( x = x_0 \in \mathbb{N} \).

\(^2\)MacMillan Double Binomial sum is the other one numerical expansion of the form

\[
\sum_{k=1}^{n} \sum_{j=1}^{k} (-1)^{k-j} j^n \binom{k}{j} \binom{x}{k} = x^n
\]
2. \( e^x \) Representation

Since the exponential function \( f(x) = e^x, \ x \in \mathbb{N} \) is defined as infinite summation of \( \frac{x^n}{n!}, \ n = 0, 1, 2, ..., \infty \) over \( n \) (see [?]). Then (1.31) could be applied, hereby

\[
\begin{align*}
(2.1) \quad e^x &= \sum_{n=0}^{\infty} \frac{1}{n!} \sum_{m=1}^{x-1} \left[\begin{array}{c} x \\ m \end{array}\right] x^{n-3} - x^{n-2} - x^{n-1} - \ldots \\
&= \sum_{n=0}^{\infty} \frac{1}{n!} \sum_{m=1}^{x-1} \left[\begin{array}{c} m^2+m+2 \\ 2 \end{array}\right] x^{n-3} - x^{n-2} - x^{n-1} - \ldots \\
&= \sum_{n=0}^{\infty} \frac{1}{n!} \sum_{k=1}^{x-1} \left[\begin{array}{c} 2x-k \\ k \end{array}\right] - 1 \left[\begin{array}{c} x+k \\ k \end{array}\right] x^{n-3} - x^{n-2} - x^{n-1} - \ldots \\
&= \sum_{n=0}^{\infty} \frac{1}{n!} \sum_{k=1}^{x-1} \left[\begin{array}{c} 2x-k \\ k \end{array}\right] + 1 \left[\begin{array}{c} 2x-k \\ 0 \end{array}\right] - 1 \left[\begin{array}{c} x+k \\ k \end{array}\right] x^{n-3} - x^{n-2} - x^{n-1} - \ldots \\
\end{align*}
\]

From (2.1) we get

\[
(2.2) \quad e^x - e = \sum_{n=0}^{\infty} \frac{1}{n!} \sum_{m=1}^{x-1} \left[\begin{array}{c} x \\ m \end{array}\right] x^{n-3} + x^{n-4} + \ldots + x + 1 \\
= \sum_{n=0}^{\infty} \frac{1}{n!} \sum_{m=1}^{x-1} \left[\begin{array}{c} m^2+m+2 \\ 2 \end{array}\right] x^{n-3} + x^{n-4} + \ldots + x + 1 \\
= \sum_{n=0}^{\infty} \frac{1}{n!} \sum_{m=1}^{x-1} \left[\begin{array}{c} m^2+m+4 \\ 2 \end{array}\right] x^{n-3} + x^{n-4} + \ldots + x + 1 \\
= \sum_{n=1}^{\infty} \frac{1}{n!} \sum_{m=1}^{x-1} \left[\begin{array}{c} m^2+m+4 \\ 2 \end{array}\right] x^{n-3} + x^{n-4} + \ldots + x + 1
\]

3. Conclusion and future research

In this paper the coefficient \( \left[\begin{array}{c} n \\ k \end{array}\right] \) was introduced in definition (1.20), its properties are shown in (1.23). Power function’s \( x^n, \ x, n \in \mathbb{N} \) expansion firstly shown in (1.20) and other versions are shown below. Going from (1.31) Power’s expansion applying (5) from properties (1.23) is shown below the subsection (1.3), ”Generalized Multinomial Theorem based definition (1.20)” . In subsection (1.1) Binomial Theorem based on definition (1.10) is shown. In section 2 we show a various representations of exponential function \( e^x, \ x \in \mathbb{N} \). In subsection (1.2) we put example of Multinomial theorem for \( n = 4 \), based on \( \left[\begin{array}{c} n \\ k \end{array}\right] \), and generalized it in subsection (1.3). We attach a Wolfram Mathematica codes of most important equations in Application 1. Extended version of Triangle (1.19) is attached in Application 2. Future research should be done in \( \left[\begin{array}{c} m^n \\ k^j \end{array}\right] \), \( m, j \in \mathbb{N} \) to verify its properties. A research on finding difference and consequently derivative using (1.31) and extend it over real functions applying Taylor’s theorem also could be done.
4. Application 1. Wolfram Mathematica 11 codes of some expressions

In this section Wolfram Mathematica codes of most expressions are shown. Note that Mathematica .cdf-file of all mentioned expressions is available for download at this link The .txt-file reader could find here.

Define coefficient $\left\lceil \left\lceil \frac{n}{k} \right\rceil \right\rceil$, definition (1.20)

\[\text{In}[1]:= K[n_, k_] := 3! * n * k - 3! * k^2 + 1\]

Check of property (1.27)

\[\text{In}[1]:= K[(n^2 + n + 2)/2, 1]\]

Check of expression (1.31), $x^n$

\[\text{In}[1]:= 1/2 * \text{Sum}[(K[2x - k, k] + K[2x - k, 0]) * x^\left(\frac{n - 3}{2}\right), \{k, 0, x - 1\}]\]

\[1/2 * \text{Sum}[(K[x + 1, k] + K[x - 1, k]) * x^\left(\frac{n - 3}{2}\right), \{k, 0, x - 1\}]\]

\[1/2 * \text{Sum}[(K[k^2 + 2 + k)/2, 1] + K[(k^2 + k + 4)/2, 1]) * x^\left(\frac{n - 3}{2}\right), \{k, 0, x - 1\}]\]
SERIES REPRESENTATION OF POWER FUNCTION

\[
\text{Sum}[K[n, k] \cdot x^{n-3}, \{k, 0, x - 1\}]
\]

\[
\text{Sum}[K[(k^2 + k + 2)/2, 1] \cdot x^{n-3}, \{k, 0, x - 1\}]
\]
