FUZZIFYING STRONGLY COMPACT SPACES AND FUZZIFYING
LOCALLY STRONGLY COMPACT SPACES

Abstract

In this paper, some characterizations of fuzzifying strong compactness are given, including characterizations in terms of nets and pre-subbases. Several characterizations of locally strong compactness in the framework of fuzzifying topology are introduced and the mapping theorems are obtained.

1 Introduction and Preliminaries

In the last few years fuzzy topology, as an important research field in fuzzy set theory, has been developed into a quite mature discipline [7-9, 12-13, 22]. In contrast to classical topology, fuzzy topology is endowed with richer structure, to a certain extent, which is manifested with different ways to generalize certain classical concepts. So far, according to Ref. [8], the kind of topologies defined by Chang [4] and Goguen [5] is called the topologies of fuzzy subsets, and further is naturally called \( L \)-topological spaces if a lattice \( L \) of membership values has been chosen. Loosely speaking, a topology of fuzzy subsets (resp. an \( L \)-topological space) is a family \( \tau \) of fuzzy subsets (resp. \( L \)-fuzzy subsets) of nonempty set \( X \), and \( \tau \) satisfies the basic conditions of classical topologies [11]. On the other hand, Höhle in [6] proposed the terminology \( L \)-fuzzy topology to be an \( L \)-valued mapping on the traditional powerset \( 2^X \) of \( X \). The authors in [10, 12-13,18] defined an \( L \)-fuzzy topology to be an \( L \)-valued mapping on the \( L \)-powerset \( L^X \) of \( X \).

In 1952, Rosser and Turquette [19] proposed emphatically the following problem: If there are many-valued theories beyond the level of predicates calculus, then what are the detail of such theories? As an attempt to give a partial answer to this problem in the case of point set topology, Ying in 1991-1993 [23-25] used a semantical method of continuous-valued logic to develop systematically fuzzifying topology. Briefly speaking, a fuzzifying topology on a set \( X \) assigns each crisp subset of \( X \) to a certain degree of being open, other than being definitely open or not. Roughly speaking, the semantical analysis approach transforms formal statements of interest, which are usually expressed as implication formulas in logical language, into some inequalities in the truth value set by truth valuation rules, and then these inequalities are demonstrated in an algebraic way and the semantic validity of conclusions is thus established. There are already more than 100 papers in fuzzifying topology published in the last two decades, I guess. But only

**Keywords and Phrases**: Lukasiewicz logic; semantics; fuzzifying topology; fuzzifying compactness; strong compactness; fuzzifying locally compactness; locally strong compactness.

a few papers can properly use the semantic method introduced in the original papers of Ying, which I strongly believe, can provide more delicate characterization of fuzzifying topological structure. So far, there has been significant research on fuzzifying topologies [1-3, 16–17, 20-21]. For example, Ying [26] introduced the concepts of compactness and established a generalization of Tychonoff’s theorem in the framework of fuzzifying topology. In [21] the concept of local compactness in fuzzifying topology is introduced and some of its properties are established. Generalized open sets play a very important role in General Topology and they are now the research topics of many topologists worldwide. Indeed a significant theme in General Topology and Real Analysis is the study of variously modified forms of continuity, separation axioms etc.

by utilizing generalized open sets. One of the most well known notions and also an inspiration source is the notion of pre-open [14] sets introduced by Mashhour, Abd El-Monsef and El-Deeb in 1982. In 1984, the authors in [15] considered a strong versions of compact spaces and locally compact spaces defined in terms of pre-open subsets of a topological space. Alternative characterizations of such spaces were obtained. In [2] the concepts of fuzzifying pre-open sets and fuzzifying pre-continuity were introduced and studied. Also, the authors in [3] introduced some concepts of fuzzifying pre-separation axioms and clarified the relations of these axioms with each other as well as the relations with other fuzzifying separation axioms. Furthermore, in [1], Abd El-Baki and Sayed characterized the concepts of fuzzifying pre-irresolute functions and used the finite intersection property to give a characterization of fuzzifying strong compact spaces. In this paper, the concepts of pre-base and pre-subbase of fuzzifying \( P \)-topology are introduced. Other characterizations of fuzzifying strong compactness are given, including characterizations in terms of nets and pre-subbase. Several characterizations of locally strong compactness in the framework of fuzzifying topology are introduced and the mapping theorems are obtained. Thus we fill a gap in the existing literature on fuzzifying topology. We use the terminology and notations in [1-3, 23–26] without any explanation. We note that the set of truth values is the unit interval and we do often not distinguish the connectives and their truth value functions and state strictly our results on formalization as Ying does. We will use the symbol \( \otimes \) instead of the second ”AND” operation \( \land \) as dot is hardly visible. This mean that

\[
[P] \leq [\varphi \to \psi] \Leftrightarrow [P] \otimes [\varphi] \leq [\psi].
\]

All of the contributions in General Topology in this paper which are not referenced may be original.

We now give some definitions and results which are useful in the rest of the present paper.

A unary fuzzy predicate \( \tau_P : 2^X \to [0, 1] \), called fuzzifying pre-open [2], is given as follows:

\[
A \in \tau_P := \forall x (x \in A \rightarrow x \in Int(Cl(A))) \quad \text{i.e.,} \quad \tau_P(A) = \bigwedge_{x \in A} \text{Int}(Cl(A))(x).
\]

Similarly, A unary fuzzy predicate \( F_P : 2^X \to [0, 1] \), called fuzzifying pre-closed [2], is given as follows: \( A \in F_P := X - A \in \tau_P \). The fuzzifying pre-neighborhood system of a point \( x \in X \) [2] is denoted by \( N^P_x \) (or \( N^P_x \)) : \( 2^X \to [0, 1] \) and defined as \( N^P_x(A) = \bigvee_{A \subseteq B \subseteq A} \tau_P(B) \). The fuzzifying pre-closure of a set \( A \subseteq X \) [2], denoted by \( Cl_P(A) \in [0, 1]^X \), is defined as \( Cl_P(A)(x) = 1 - N^P_x(X - A) \). If \( (X, \tau) \) is a fuzzifying topological space and \( N(X) \) is the class of all nets in \( X \), then the binary fuzzy predicates \( \triangleright^P, \bowtie^P : N(X) \times X \to [0, 1] \) [20] are defined as

\[
S \triangleright^P x := \forall A (A \in N^P_x \rightarrow S \subseteq A), \quad S \bowtie^P x := \forall A (A \in N^P_x \rightarrow S \subseteq A),
\]
where “$S \rightharpoonup^P x$”, “$S \preceq^P x$” stand for “$S$ pre-converges to $x$”, “$x$ is a pre-accumulation point of $S$”, respectively; and “$\exists!$”, “$\exists^*$” are the binary crisp predicates “almost in”, “often in”, respectively. The degree to which $x$ is a pre-adherence point of $S$ is $\text{adh}_PS(x) = [S \preceq^P x]$. If $(X, \tau)$ and $(Y, \sigma)$ are two fuzzifying topological spaces and $f \in Y^X$, the unary fuzzy predicates $C_P, I_P : Y^X \to [0,1]$, called fuzzifying pre-continuity [2], fuzzifying pre-irresoluteness [1], are given as

$$C_P(f) := \forall B(B \in \sigma \to f^{-1}(B) \in \tau_P), \quad I_P(f) := \forall B(B \in \sigma_P \to f^{-1}(B) \in \tau_P),$$

respectively. Let $\Omega$ be the class of all fuzzifying topological spaces. A unary fuzzy predicate $T_2^P : \Omega \to [0,1]$, called fuzzifying pre-Hausdorffness [3], is given as follows:

$$T_2^P(X, \tau) = \forall x \forall y((x \in X \land y \in X \land x \neq y) \to \exists B \exists C(B \in N_x^P \land C \in N_y^P \land B \cap C \equiv \phi)).$$

A unary fuzzy predicate $\Gamma : \Omega \to [0,1]$, called fuzzifying compactness [26], is given as follows:

$$\Gamma(X, \tau) := (\forall \mathcal{R})(K_{\mathcal{R}}( \mathcal{R}, X) \longrightarrow (\exists \varphi)((\varphi \leq \mathcal{R}) \land K(\varphi, A) \otimes FF(\varphi)))$$

and if $A \subseteq X$, then $\Gamma(A) := \Gamma(A, \tau/A)$. For $K$, $K_0$ (resp. $\leq$ and $FF$) see [24, Definition 4.4] (resp. [24, Theorem 4.3] and [26, Definition 1.1 and Lemma 1.1]). A unary fuzzy predicate $fI : [0,1]^{2X} \to [0,1]$, called fuzzy finite intersection property [26], is given as

$$fI(\mathcal{R}) := \forall \varphi((\varphi \leq \mathcal{R}) \land FF(\varphi) \to \exists x \forall B(B \in \varphi \to x \in B)).$$

A fuzzifying topological space $(X, \tau)$ is said to be fuzzifying $P$-topological space [1] if $\tau_P(A \cap B) \geq \tau_P(A) \land \tau_P(B)$. A binary fuzzy predicate $K_P : [0,1]^{2X \times 2X} \to [0,1]$, called fuzzifying pre-open covering [1], is given as $K_P( \mathcal{R}, A) := K( \mathcal{R}, A) \otimes (\mathcal{R} \subseteq \tau_P)$. A unary fuzzy predicate $\Gamma_P : \Omega \to [0,1]$, called fuzzifying strongly compactness [1], is given as follows:

$$(X, \tau) \in \Gamma_P := (\forall \mathcal{R})(K_P( \mathcal{R}, X) \longrightarrow (\exists \varphi)((\varphi \leq \mathcal{R}) \land K(\varphi, X) \otimes FF(\varphi)))$$

and if $A \subseteq X$, then $\Gamma_P(A) := \Gamma_P(A, \tau/A)$. It is obvious that

$$\Gamma_P(X, \tau) := \Gamma(X, \tau_P), \quad \Gamma_P(A, \tau/A) := \Gamma(A, \tau_P/A)$$

and

$$\equiv K_0( \mathcal{R}, A) \longrightarrow K_P( \mathcal{R}, A).$$

A fuzzifying strongly compact space is a generalization of strongly compact space [15]. A space $X$ is said to be strongly compact if every pre-open cover $X$ has a finite subcover.

A unary fuzzy predicate $LC : \Omega \to [0,1]$, called fuzzifying locally compactness [21], is given as follows:

$$(X, \tau) \in LC := (\forall x)(\exists B)((x \in \text{Int}(B) \otimes \Gamma(B, \tau/B))).$$

A space $X$ is said to be locally strongly compact [15] if each point of $X$ has a neighbourhood which is a strongly compact subspace.
2 Fuzzifying pre-base and pre-subbase

Definition 2.1 Let \((X, \tau)\) be a fuzzifying topological space and \(\beta_P \subseteq \tau\). Then \(\beta_P\) is called a pre-base of \(\tau\) if \(\beta_P\) fulfils the condition: \(\forall A \in \mathcal{N}_P X \rightarrow \exists B ((B \in \beta_P) \land (x \in B \subseteq A))\).

Example 2.1 Let \(X = \{a, b, c\}\), and \(I = [0, 1]\). Define a mapping \(\tau : P(X) \rightarrow I\) on \(X\) as follows: \(\tau(\emptyset) = \tau(X) = 1\), \(\tau(\{a, c\}) = 0\), \(\tau(\{a, b\}) = \frac{1}{2}\), \(\tau(\{b, c\}) = \frac{1}{2}\), \(\tau(\{a\}) = 0\), \(\tau(\{b\}) = \frac{3}{4}\), \(\tau(\{c\}) = \frac{1}{2}\). Then we can easily verify that \(\tau\) is a fuzzifying topology. By calculating, \(\tau_P(\emptyset) = \tau_P(X) = 1\), \(\tau_P(\{a, c\}) = \frac{1}{4}\), \(\tau_P(\{a, b\}) = 1\), \(\tau_P(\{b, c\}) = 1\), \(\tau_P(\{a\}) = \frac{1}{4}\), \(\tau_P(\{b\}) = \frac{3}{4}\), \(\tau_P(\{c\}) = 1\). If we set \(\beta_P = \tau_P\), then \(N_P^P X = \bigvee_{x \in B \subseteq A} \tau(B) = \bigvee_{x \in B \subseteq A} \beta_P(B)\). Obviously, \(\beta_P\) is a pre-base of \(\tau\) by Definition 2.1.

Theorem 2.1 \(\beta_P\) is a pre-base of \(\tau\) if and only if \(\tau = \bigwedge_{\lambda \in \Lambda} \beta_P(B_\lambda)\), where

\[
\beta_P^{(\cup)}(A) = \bigvee_{\lambda \in \Lambda} \bigwedge_{B_\lambda = A} \beta_P(B_\lambda).
\]

Proof. Suppose that \(\beta_P\) is a pre-base of \(\tau\). If

\[
\bigcup_{\lambda \in \Lambda} B_\lambda = A,
\]

then from Theorem 3.1 (1) (b) in [2],

\[
\tau_P(A) = \tau_P \left( \bigcup_{\lambda \in \Lambda} B_\lambda \right) \geq \bigwedge_{\lambda \in \Lambda} \tau_P(B_\lambda) \geq \bigwedge_{\lambda \in \Lambda} \beta_P(B_\lambda).
\]

Consequently,

\[
\tau_P(A) \geq \bigvee_{\lambda \in \Lambda} \bigwedge_{B_\lambda = A} \beta_P(B_\lambda).
\]

To prove that

\[
\tau_P(A) \leq \bigvee_{\lambda \in \Lambda} \bigwedge_{B_\lambda = A} \beta_P(B_\lambda),
\]

we first prove

\[
\tau_P(A) = \bigwedge_{x \in A} \bigvee_{x \in B \subseteq A} \tau_P(B).
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]

(Indeed, assume \(\delta_x = \{B : x \in B \subseteq A\}\). Then for any

\[
f \in \prod_{x \in A} \delta_x, \bigcup_{x \in A} f(x) = A,
\]
and furthermore

$$\tau_P(A) = \tau_P \left( \bigcup_{x \in A} f(x) \right)$$

$$\geq \bigwedge_{x \in A} \tau_P(f(x))$$

$$\geq \bigvee_{f \in \prod \delta_x \ x \in A} \bigwedge_{x \in A} \tau_P(f(x))$$

$$= \bigwedge_{x \in A} \bigvee_{x \in B \subseteq A} \tau_P(B).$$

Also

$$\tau_P(A) \leq \bigwedge_{x \in A} \bigvee_{x \in B \subseteq A} \tau_P(B).$$

Therefore

$$\tau_P(A) = \bigwedge_{x \in A} \bigvee_{x \in B \subseteq A} \tau_P(B).$$

Now, since

$$N_P^X(A) \leq \bigvee_{x \in B \subseteq A} \beta_P(B),$$

$$\tau_P(A) = \bigwedge_{x \in A} \bigvee_{x \in B \subseteq A} \tau_P(B) = \bigwedge_{x \in A} N_P^X(A)$$

$$\leq \bigwedge_{x \in A} \bigvee_{x \in B \subseteq A} \beta_P(B) = \bigvee_{f \in \prod \delta_x \ x \in A} \beta_P(f(x)).$$

Then

$$\tau_P(A) \leq \bigvee_{\bigcup_{\lambda \in \Lambda} B_{\lambda} = A} \bigwedge_{\lambda \in \Lambda} \beta_P(B_{\lambda}).$$

Therefore

$$\tau_P(A) = \bigvee_{\bigcup_{\lambda \in \Lambda} B_{\lambda} = A} \bigwedge_{\lambda \in \Lambda} \beta_P(B_{\lambda}).$$

In the other side, we assume

$$\tau_P(A) = \bigvee_{\bigcup_{\lambda \in \Lambda} B_{\lambda} = A} \bigwedge_{\lambda \in \Lambda} \beta_P(B_{\lambda}).$$

and we will show that $\beta_P$ is a pre-base of $\tau_P$, i.e., for any $A \subseteq X$, $N_P^X(A) \leq \bigvee_{x \in B \subseteq A} \beta_P(B)$. Indeed, if $x \in B \subseteq A$, $\bigcup_{\lambda \in \Lambda} B_{\lambda} = B$, then there exists $\lambda_0 \in \Lambda$ such that $x \in B_{\lambda_0}$ and

$$\bigwedge_{\lambda \in \Lambda} \beta_P(B_{\lambda}) \leq \beta_P(B_{\lambda_0}) \leq \bigvee_{x \in B \subseteq A} \beta_P(B).$$
Therefore

\[ N_x^{P_X}(A) = \bigvee_{x \in B \subseteq A} \tau_P(B) = \bigvee_{x \in B \subseteq A} \bigwedge_{\lambda \in \Lambda} \beta_P(B_\lambda) \leq \bigvee_{x \in B \subseteq A} \beta_P(B). \]

\[ \text{Theorem 2.2} \]

Let \( \beta_P : 2^X \to [0,1] \). Then \( \beta_P \) is a pre-base for some fuzzifying \( P \)-topology \( \tau_P \) if and only if it has the following properties:

1. \( \beta_P^{(\cup)}(X) = 1; \)
2. \( \vDash (A \in \beta_P) \land (B \in \beta_P) \land (x \in A \cap B) \rightarrow \exists C((C \in \beta_P) \land (x \in C \subseteq A \cap B)). \)

**Proof.** If \( \beta_P \) is a pre-base for some fuzzifying \( P \)-topology \( \tau_P \), then \( \tau_P(X) = \beta_P^{(\cup)}(X) \). Clearly, \( \beta_P^{(\cup)}(X) = 1 \).

In addition, if \( x \in A \cap B \), then

\[ \beta_P(A) \land \beta_P(B) \leq \tau_P(A) \land \tau_P(B) \leq \tau_P(A \cap B) \leq N_x^{P_X}(A \cap B). \]

Conversely, if \( \beta_P \) satisfies (1) and (2), then we have \( \tau_P \) is a fuzzifying \( P \)-topology. In fact, \( \tau_P(X) = 1 \). For any \( \{ A_\lambda : \lambda \in \Lambda \} \subseteq P(X) \), we set

\[ \delta_\lambda = \left\{ B_{\Phi_\lambda} : \Phi_\lambda \in \Lambda_\lambda \right\} : \bigcup_{\Phi_\lambda \in \Lambda_\lambda} B_{\Phi_\lambda} = A_\lambda \right\}. \]

Then for any

\[ f \in \prod_{\lambda \in \Lambda} \delta_\lambda, \quad \bigcup_{\lambda \in \Lambda} \bigcup_{B_{\Phi_\lambda} \in f(\lambda)} B_{\Phi_\lambda} = \bigcup_{\lambda \in \Lambda} A_\lambda. \]

Therefore

\[ \tau_P \left( \bigcup_{\lambda \in \Lambda} A_\lambda \right) = \bigvee_{\Phi \in \Lambda} A_\lambda \bigwedge_{\Phi \in \Lambda} \beta_P(B_{\Phi}) \geq \bigvee_{\lambda \in \Lambda} \bigwedge_{\Phi_\lambda \in \Lambda_\lambda} \beta_P(B_{\Phi_\lambda}) \geq \bigwedge_{\lambda \in \Lambda} \left\{ B_{\Phi_\lambda} : \Phi_\lambda \in \Lambda_\lambda \right\} \bigwedge_{\lambda \in \Lambda} \beta_P(B_{\Phi_\lambda}) = \bigwedge_{\lambda \in \Lambda} \tau_P(A_\lambda). \]

Finally, we need to prove that

\[ \tau_P(A \cap B) \geq \tau_P(A) \land \tau_P(B). \]

If \( \tau_P(A) > t, \tau_P(B) > t \), then there exists

\[ \{ B_{\lambda_1} : \lambda_1 \in \Lambda_1 \}, \quad \{ B_{\lambda_2} : \lambda_2 \in \Lambda_2 \} \]
such that
\[ \bigcup_{\lambda_1 \in \Lambda_1} B_{\lambda_1} = A, \quad \bigcup_{\lambda_2 \in \Lambda_2} B_{\lambda_2} = B \]
and for any
\[ \lambda_1 \in \Lambda_1, \quad \beta_P(B_{\lambda_1}) > t, \]
for any \( \lambda_2 \in \Lambda_2, \ \beta_P(B_{\lambda_2}) > t \). Now, for any \( x \in A \cap B \), there exists \( \lambda_1 \in \Lambda_1, \ \lambda_2 \in \Lambda_2 \) such that \( x \in B_{\lambda_1} \cap B_{\lambda_2} \). From the assumption, we know that
\[ t < \beta_P(B_{\lambda_1}) \land \beta_P(B_{\lambda_2}) \leq \bigvee_{x \in C \subseteq B_{\lambda_1} \cap B_{\lambda_2}} \beta_P(C) \]
and furthermore, there exists \( C_x \) such that
\[ x \in C_x \subseteq B_{\lambda_1} \cap B_{\lambda_2} \subseteq A \cap B, \ \beta_P(C_x) > t. \]
Since
\[ \bigcup_{x \in A \cap B} C_x = A \cap B, \]
we have
\[ t \leq \bigwedge_{x \in A \cap B} \beta_P(C_x) \leq \bigvee_{\lambda \in \bigcup \Lambda} \bigwedge_{\lambda \in \Lambda} \beta_P(B_{\lambda}) = \tau_P(A \cap B). \]
Now, let \( \tau_P(A) \land \tau_P(B) = k. \) For any natural number \( n \), we have
\[ \tau_P(A) > k - \frac{1}{n}, \ \tau_P(B) > k - \frac{1}{n} \]
and so \( \tau_P(A \cap B) \geq k - \frac{1}{n}. \) Therefore \( \tau_P(A \cap B) \geq k = \tau_P(A) \land \tau_P(B). \)

**Definition 2.2** \( \varphi_P : 2^X \rightarrow [0, 1] \) is called a pre-subbase of \( \tau_P \) if \( \varphi_P^0 \) is a pre-base of \( \tau_P \), where
\[ \varphi_P^0(\bigcap_{\lambda \in \Lambda} B_{\lambda}) = \bigvee_{\lambda \in \Lambda} \bigwedge_{\lambda \in A} \varphi_P(B_{\lambda}) \]
and \( \{B_{\lambda} : \lambda \in \Lambda\} \subseteq P(X) \), with ” \( \subseteq \) " standing for "a finite subset of".

**Theorem 2.3** \( \varphi_P : 2^X \rightarrow [0, 1] \) is a pre-subbase of some fuzzifying \( P \)-topology if and only if \( \varphi_P^{(\cup)}(X) = 1. \)

**Proof.** We only demonstrate that \( \varphi_P^0 \) satisfies the second condition of Theorem 2.2, and others are obvious. In fact
\[ \varphi_P^0(A) \land \varphi_P^0(B) = \left( \bigvee_{\lambda_1 \in \Lambda_1} \bigwedge_{A_1 \in A} \varphi_P(B_{\lambda_1}) \right) \land \left( \bigvee_{\lambda_2 \in \Lambda_2} \bigwedge_{B_2 \in B} \varphi_P(B_{\lambda_2}) \right) \]
\[ = \bigvee_{\lambda_1 \in \Lambda_1} \bigvee_{B_1 \subseteq A} \left( \bigwedge_{\lambda_1 \in A_1} \varphi_P(B_{\lambda_1}) \right) \land \left( \bigwedge_{\lambda_2 \in \Lambda_2} \varphi_P(B_{\lambda_2}) \right) \]
\[ \leq \bigvee_{\lambda \in \Lambda} \left( \bigwedge_{A \cap B} \varphi_P(B_{\lambda}) \right) \]
\[ = \varphi_P^0(A \cap B). \]
Therefore if $x \in A \cap B$, then
\[
\varphi_P^\emptyset(A) \wedge \varphi_P^\emptyset(B) \leq \varphi_P^\emptyset(A \cap B) \leq \bigvee_{x \in C \subseteq A \cap B} \varphi_P^\emptyset(C).
\]

3 Fuzzifying strong compact spaces

Theorem 3.1 Let $(X, \tau)$ be a fuzzifying topological space, $\varphi_P$ be a pre-subbase of $\tau_P$, and

\[
(\beta_1) := (\forall \mathcal{R})(K_{\varphi_P}(\mathcal{R}, X) \rightarrow \exists \phi((\varphi \leq \mathcal{R}) \wedge K(\varphi, X) \otimes FF(\phi))), \text{ where } K_{\varphi_P}(\mathcal{R}, X) := K(\mathcal{R}, X) \otimes (\mathcal{R} \subseteq \varphi_P);
\]

\[
(\beta_2) := (\forall S)((S \text{ is a universal net in } X) \rightarrow \exists x((x \in X) \wedge (S \triangleright^P x));
\]

\[
(\beta_3) := (\forall S)((S \in N(X) \rightarrow (\forall T)(\exists x)((T < S) \wedge (x \in X) \wedge (T \triangleright^P x))),
\]

where "$T < S$" stands for "$T$ is a subnet of $S$";

\[
(\beta_4) := (\forall S)((S \in N(X) \rightarrow \neg(\text{adh}_P S \equiv \phi));
\]

\[
(\beta_5) := (\forall \mathcal{R})(\mathcal{R} \in [0, 1]^{2^X} \wedge \mathcal{R} \subseteq F_P \otimes fI(\mathcal{R}) \rightarrow \exists x\forall A(A \in \mathcal{R} \rightarrow x \in A)).
\]

Then $\exists (X, \tau) \in \Gamma_P \leftrightarrow \beta_i, i = 1, 2, \ldots, 5.$

**Proof.** (1) Since $\varphi_P \subseteq \tau_P$, $[\mathcal{R} \subseteq \varphi_P] \leq [\mathcal{R} \subseteq \tau_P]$ for any $\mathcal{R} : 2^X \rightarrow [0, 1]$, then we have $[K_{\varphi_P}(\mathcal{R}, X)] \leq [K_P(\mathcal{R}, X)]$. Therefore $\Gamma_P(X, \tau) \leq [\beta_1].$

(2) $[\beta_2] = \bigwedge \{ \bigvee_{x \in X} [S \triangleright^P x] : (S \text{ is a universal net in } X) \}.$

(2.1) Assume $X$ is finite. We set $X = \{ x_1, \ldots, x_m \}$. For any universal net $S$ in $X$, there exists $i_0 \in \{ 1, \ldots, m \}$ with $S \subseteq \{ x_{i_0} \}$. In fact, if not, then for any $i \in \{ 1, \ldots, m \}$, $S \subseteq \{ x_i \}$ and $S \cap (X - \{ x_i \}) = \phi$, a contradiction. Therefore $x_{i_0} \notin A$ and $N_{x_{i_0}}^P(A) = 0$ (see[2], Theorem 4.2 (1)) provided $S \subseteq A$, and furthermore $[S \triangleright^P x_{i_0}] = \bigwedge_{s \subseteq A} \left( 1 - N_{x_{i_0}}^P(A) \right) = 1.$

Therefore $[\beta_2] = 1 \geq [\beta_1].$

(2.2) In general, to prove that $[\beta_1] \leq [\beta_2]$ we prove that for any $\lambda \in [0, 1]$, if $[\beta_2] < \lambda$, then $[\beta_1] < \lambda$. Assume for any $\lambda \in [0, 1], [\beta_2] < \lambda$. Then there exists a universal net $S$ in $X$ such that $\bigvee_{x \in X} [S \triangleright^P x] < \lambda$ and for any $x \in X$, $[S \triangleright^P x] = \bigwedge_{s \subseteq A} \left( 1 - N_x^P(A) \right) < \lambda$, i.e., there exists $A \subseteq X$ with $S \subseteq A$ and $N_x^P(A) > 1 - \lambda$. Since $\varphi_P$ is a pre-subbase of $\tau_P$, $\varphi_P^\emptyset$ is a pre-base of $\tau_P$, and from Definition 2.1, we have $\bigvee_{x \in B \subseteq A} \varphi_P^\emptyset(B) \geq N_x^P(A) > 1 - \lambda$, i.e., there exists $B \subseteq A$ such that $x \in B \subseteq A$ and $\bigvee_{x \in \Lambda} \left\{ \min_{\lambda \in \Lambda} \varphi_P(B_\lambda) : \bigcap_{\lambda \in \Lambda} B_\lambda = B, B_\lambda \subseteq X, \lambda \in \Lambda \right\} = \varphi_P^\emptyset(B) > 1 - \lambda$, where $\Lambda$ is finite. Therefore there exists a finite set $\Lambda$ and $B_\lambda \subseteq X(\lambda \in \Lambda)$ such that $\bigcap_{\lambda \in \Lambda} B_\lambda = B$ and for any $\lambda \in \Lambda, \varphi_P(B_\lambda) > 1 - \lambda$. Since $S \subseteq A$ and $\Lambda$ is finite, there exists $\lambda(x) \in \Lambda$ such that $S \subseteq B_{\lambda(x)}$. We set $\mathcal{R}_0(B_{\lambda(x)}) = \bigvee_{x \in X} \varphi_P(B_{\lambda(x)}).$
If $\varphi \leq \mathcal{R}$, then for any $\delta > 0$, $\varphi \delta \subseteq \{B_{\lambda(x)} : x \in X\}$. Consequently, for any $B \in \varphi \delta$, $S \not\subseteq B$ and $S \subseteq B^c$ because $S$ is a universal net. If

$$[FF(\varphi)] = 1 - \inf \{\delta \in [0, 1] : F(\varphi \delta)\} = t,$$

then for any $n \in w$ (the non-negative integer),

$$\inf \{\delta \in [0, 1] : F(\varphi \delta)\} < 1 - t + \frac{1}{n},$$

and there exists $\delta_0 < 1 - t + \frac{1}{n}$ such that $F(\varphi \delta_0)$. If $\delta_0 = 0$, then $P(X) = \varphi \delta_0$ is finite and it is proved in (2.1). If $\delta_0 > 0$, then for any $B \in \varphi \delta_0$, $S \subseteq B^c$. Since $F(\varphi \delta_0)$, we have

$$S \subseteq \bigcap\{B^c : B \in \varphi \delta_0\} \neq \phi,$$

i.e., $\bigcup \varphi \delta_0 \neq X$ and there exist $x_0 \in X$ such that for any $B \in \varphi \delta_0$, $x_0 \notin B$. Therefore, if $x_0 \in B$, then $B \notin \varphi \delta_0$, i.e.,

$$\varphi(B) < \delta_0, K(\varphi, X) = \bigwedge_{x \in X} \bigvee_{x \in B} \varphi(B) \leq \bigvee_{x \in B} \varphi(B) \leq \delta_0 < 1 - t + \frac{1}{n}. $$

Let $n \to \infty$. We obtain $K(\varphi, X) \leq 1 - t$ and $[K(\varphi, X) \otimes FF(\varphi)] = 0$. In addition, $[K_{\varphi_p}(\mathcal{R}, X)] \geq 1 - \lambda$. In fact, $[\mathcal{R} \subseteq \varphi_p] = 1$ and

$$[K(\mathcal{R}, X)] = \bigwedge_{x \in X} \bigvee_{x \in B} \mathcal{R}(B) \geq \bigwedge_{x \in X} \mathcal{R}(B_{\lambda(x)}) \geq \bigwedge_{x \in X} \varphi_p(B_{\lambda(x)}) \geq 1 - \lambda$$

because $x \in B_{\lambda(x)}$. Now, we have

$$[\beta_1] = (\forall \mathcal{R})(K_{\varphi_p}(\mathcal{R}, X) \to \exists \varphi((\varphi \leq \mathcal{R}) \land K(\varphi, X) \otimes FF(\varphi)))$$

$$\leq K_{\varphi_p}(\mathcal{R}, X) \to \exists \varphi((\varphi \leq \mathcal{R}) \land K(\varphi, X) \otimes FF(\varphi))$$

$$= \min(1, 1 - K_{\varphi_p}(\mathcal{R}, X) + \bigvee_{\varphi \leq \mathcal{R}} [K(\varphi, X) \otimes FF(\varphi)]) \leq \lambda.$$

By noticing that $\lambda$ is arbitrary, we have $[\beta_1] \leq [\beta_2]$.

(3) It is immediate that $[\beta_2] \leq [\beta_3]$.

(4) To prove that $[\beta_3] \leq [\beta_4]$, first we prove that

$$[\exists T \ ((T < S) \land (T \triangleright P x))] \leq [S \propto P x],$$

where

$$[\exists T \ ((T < S) \land (T \triangleright P x))] = \bigvee_{T < S} \bigwedge_{T \not\triangleright A} (1 - N_x^P(A))$$

and

$$[S \propto P x] = \bigwedge_{T \not\triangleright A} (1 - N_x^P(A)) .$$

Indeed, for any $T < S$ one can deduce $\{A : S \not\triangleright A\} \subseteq \{A : T \not\triangleright A\}$ as follows. Suppose $T = S \circ K$. If $S \not\triangleright A$, then there exists $m \in D$ such that $S(n) \notin A$ when $n \geq m$, where $\geq$ directs the domain $D$ of $S$. Now, we will show that $T \not\triangleright A$. If not, then there exists $p \in E$ such that
T(q) ∈ A when q ≥ p, where ≥ directs the domain E of T. Moreover, there exists n₁ ∈ E such that K(n₁) ≥ m because T < S, and there exists n₂ ∈ E such that n₂ ≥ n₁, p because (E, ≥) is directed. So, K(n₂) ≥ K(n₁) ≥ m, S ∩ K(n₂)  ̸∈ A and S ∩ K(n₂) = T(n₂) ∈ A. They are contrary. Hence

\[ \{A : S \not\in A\} \subseteq \{A : T \not\in A\}. \]

Therefore

\[
[\exists T ((T < S) \land (T \triangleright^p x))] = \bigvee_{T < S} \bigwedge_{T \not\in A} (1 - N^P_x(A))
\]

\[
= \bigvee_{T < S} \bigwedge_{\{A : T \not\in A\}} (1 - N^P_x(A))
\]

\[
\leq \bigwedge_{\{A : T \not\in A\}} (1 - N^P_x(A))
\]

\[
= \bigwedge_{x \in X} (1 - N^P_x(A)) = [S \not\in x].
\]

Therefore for any x ∈ X and S ∈ N(X) we have

\[
[\beta_3] = \bigwedge_{x \in X} \bigvee_{x \in X} \bigwedge_{s \in N(X)} [\exists T ((T < S) \land (T \triangleright^p x))]
\]

\[
\leq \bigwedge_{s \in N(X)} \bigvee_{x \in X} [S \not\in x] = \bigwedge_{s \in N(X)} \neg \left( \bigwedge_{x \in X} (1 - [S \not\in x]) \right)
\]

\[
= \bigwedge_{s \in N(X)} \neg (\text{adh}_P S \equiv \phi) = [\beta_4].
\]

(5) We want to show that [\beta_4] ≤ [\beta_3]. For any \( \mathcal{R} : 2^X \rightarrow [0, 1] \), assume \([fI(\mathcal{R})] = \lambda\). Then for any \( \delta > 1 - \lambda \), if \( A_1, ..., A_n \in \mathcal{R}_\delta \), \( A_1 \cap A_2 \cap ... \cap A_n \neq \phi \). In fact, we set \( \varphi(A_i) = \bigvee_{i=1}^n \mathcal{R}(A_i) \). Then \( \varphi \leq \mathcal{R} \) and \( FF(\varphi) = 1 \). By putting \( \varepsilon = \lambda + \delta - 1 > 0 \), we obtain

\[
\lambda - \varepsilon < \lambda \leq [FF(\varphi) \rightarrow (\exists x)(\forall B)(B \in \varphi \rightarrow x \in B)] = \bigvee_{x \in X} (1 - \varphi(B)).
\]

There exists \( x_0 \in X \) such that \( \lambda - \varepsilon < \bigvee_{x \in B} (1 - \varphi(B)) \), \( x_0 \notin B \) implies \( \varphi(B) < 1 - \lambda + \varepsilon = \delta \) and \( x_0 \in \cap \varphi = A_1 \cap A_2 \cap ... \cap A_n \). Now, we set \( \vartheta = \{A_1 \cap A_2 \cap ... \cap A_n : n \in N, A_1, ..., A_n \in \mathcal{R}_\delta\} \) and \( S : \vartheta \rightarrow X, B \mapsto x_B \in B, B \in \vartheta \) and know that \( (\vartheta, \subseteq) \) is a directed set and \( S \) is a net in \( X \). Therefore

\[
[\beta_4] \leq \neg (\text{adh}_P S \equiv \phi) = \bigvee_{x \in X} \bigwedge_{S \not\in A} (1 - N^P_x(A)).
\]

Assume \([\mathcal{R} \subseteq F_P] = \mu\). Then for any \( B \in P(X), \mathcal{R}(B) \leq 1 + F_P(B) - \mu \), and

\[
[\mathcal{R} \subseteq F_P \otimes fI(A) \rightarrow (\exists x)(\forall A)((A \in \mathcal{R}) \rightarrow x \in A)] = \min(1, 2 - \mu - \lambda + \bigvee_{x \in X} \bigwedge_{x \notin A} (1 - \mathcal{R}(A))).
\]
Therefore it suffices to show that for any 
\[ x \in X, \bigwedge_{\tilde{S}_{\varnothing}A} (1 - N^F_x(A)) \leq 2 - \mu - \lambda + \bigwedge_{x \notin A} (1 - \Re(A)), \]
i.e.,
\[ \bigvee_{x \notin A} \Re(A) \leq 2 - \mu - \lambda + \bigvee_{\tilde{S}_{\varnothing}A} N^F_x(A) \]
for some \( \delta > 1 - \lambda \). For any \( t \in [0, 1] \), if \( \bigvee_{x \notin A} \Re(A) > t \), then there exists \( A_0 \) such that \( x_o \notin A_0 \)
and \( \Re(A_0) > t \).

Case 1. \( t \leq 1 - \lambda \), then \( t \leq 2 - \mu - \lambda + \bigvee_{\tilde{S}_{\varnothing}A} N^F_x(A) \).

Case 2. \( t > 1 - \lambda \). Here we set \( \delta = \frac{1}{2}(t + 1 - \lambda) \) and have \( A_o \in \Re_\delta, A_o \in \vartheta_\delta \). In addition,
\[ t < \Re(A_o) \leq 1 + F_P(A_o) - \mu, \ t + \mu - 1 \leq F_P(A_o) = \tau_P(A_o). \]

Since \( A_o \in \vartheta_\delta \), we know that \( S_B \in A_o \), i.e., \( S_B \notin A^c_o \) when \( B \subseteq A_o \) and \( S \not\sim A^c_o \). Therefore,
\[ 2 - \mu - \lambda + \bigvee_{\tilde{S}_{\varnothing}A} N^F_x(A) \geq 2 - \mu - \lambda + N^F_x(A^c_o) \geq 2 - \mu - \lambda + \tau_P(A^c_o) \geq t + (1 - \lambda) \geq t. \]

By noticing that \( t \) is arbitrary, we have completed the proof.

(6) To prove that \( [\beta_o] = [(X, \tau) \in \Gamma_P] \) see [1] Theorem 6. ■

The above theorem is a generalization of the following corollary.

**Corollary 3.1** The following are equivalent for a topological space \((X, \tau)\).

(a) \( X \) is a strong compact space.

(b) Every cover of \( X \) by members of a pre-subbase of \( \tau_P \) has a finite subcover.

(c) Every universal net in \( X \) pre-converges to a point in \( X \).

(d) Each net in \( X \) has a subnet that pre-converges to some point in \( X \).

(e) Each net in \( X \) has a pre-adherent point.

(f) Each family of pre-closed sets in \( X \) that has the finite intersection property has a non-void intersection.

The equivalence (a), (b) and (c) were given in [15].

**Definition 3.1** Let \( \{ (X_s, \tau_s) : s \in S \} \) be a family of fuzzifying topological spaces, \( \prod_{s \in S} X_s \) be the cartesian product of \( \{ X_s : s \in S \} \) and \( \varphi = \{ p_s^{-1}(U_s) : s \in S, U_s \in P(X_s) \} \), where \( p_t : \prod_{s \in S} X_s \to X_t (t \in S) \) is a projection. For \( \Phi \subseteq \varphi, S(\Phi) \) stands for the set of indices of elements in \( \Phi \). The pre-base \( \beta_P : \prod_{s \in S} X_s \to [0, 1] \) of \( \prod_{s \in S} (\tau_P)_s \) is defined as
\[ V \in \beta_P := (\exists \Phi)(\Phi \subseteq \varphi \land (\bigcap \Phi = V)) \to \forall s \in S(\Phi) \to V_s \in (\tau_P)_s, \]
i.e.,
\[ \beta_P(V) = \bigvee_{\Phi \subseteq \varphi \land \Phi = V} \bigwedge_{s \in S(\Phi)} (\tau_P)_s(V_s). \]
Example 3.1 Let \((X, \tau)\) and \(\tau_P\) be just as in Example 2.1. Define a mapping \(\varsigma : P(Y) \rightarrow I\) on \(Y\) as follows: \(\varsigma(\emptyset) = \varsigma(Y) = 1\), where \(Y = \{d\}\), then \(\varsigma\) is a fuzzifying topology and \(\varsigma_P(\emptyset) = \varsigma_P(Y) = 1\). Hence, \(Y \times X = \{(d, a), (d, b), (d, c)\}\), so \(\varphi = \{\emptyset, X \times Y, \{(d, a)\}, \{(d, b)\}, \{(d, c)\}, \{(d, a), (d, b)\}, \{(d, a), (d, c)\}, \{(d, b), (d, c)\}, \{(d, a), (d, b), (d, c)\}\}. By calculating, \(\beta_P(\emptyset) = 1, \beta_P(X \times Y) = 1, \beta_P(\{(d, a)\}) = \frac{1}{3}, \beta_P(\{(d, b)\}) = \frac{3}{4}, \beta_P(\{(d, c)\}) = \frac{1}{2}, \beta_P(\{(d, a), (d, b)\}) = \frac{1}{2}, \beta_P(\{(d, b), (d, c)\}) = 1\). According to Theorem 2.1, we can easily obtain \(\beta_P(U) = \beta_P\), so \(\tau_P \times \varsigma_P = \tau_P\).

Definition 3.2 Let \((X, \tau), (Y, \sigma)\) be two fuzzifying topological space. A unary fuzzy predicate \(O_P : Y^X \rightarrow [0, 1]\), is called fuzzifying pre-openness, is given as: \(O_P(f) = \forall U \in \tau_P \rightarrow f(U) \in \sigma_P\). Intuitively, the degree to which \(f\) is pre-open is

\[
\begin{align*}
O_P(f) = \bigwedge_{B \subseteq X} \min(1, 1 - \tau_P(U) + \sigma_P(f(U))).
\end{align*}
\]

Example 3.2 Let \((X, \tau)\) and \(\tau_P\) be defined just as in Example 2.1. We set \(Y = X, \sigma = \tau\) and \(f = \text{id}_X\), then

\[
\begin{align*}
O_P(f) = \bigwedge_{U \subseteq X} \min(1, 1 - \tau_P(U) + \sigma_P(f(U))) = 1.
\end{align*}
\]

Lemma 3.1 Let \((X, \tau)\) and \((Y, \sigma)\) be two fuzzifying topological space. For any \(f \in Y^X\),

\[
O_P(f) = \forall B \in \beta_P^X \rightarrow f(B) \in \sigma_P,
\]

where \(\beta_P^X\) is a pre-base of \(\tau_P\).

Proof. Clearly, \([O_P(f)] \leq [\forall U \in \beta_P^X \rightarrow f(U) \in \sigma_P]\). Conversely, for any \(U \subseteq X\), we are going to prove

\[
\min(1, 1 - \tau_P(U) + \sigma_P(f(U))) \geq [\forall V \in \beta_P^X \rightarrow f(V) \in \sigma_P].
\]

If \(\tau_P(U) \leq \sigma_P(f(U))\), it is hold clearly. Now assume \(\tau_P(U) > \sigma_P(f(U))\). If \(\emptyset \in P(X)\) with \(\bigcup \emptyset = U\), then \(\bigcup_{V \in \emptyset} f(V) = f(\bigcup \emptyset) = f(U)\). Therefore

\[
\begin{align*}
\tau_P(U) - \sigma_P(f(U)) &= \bigvee_{\emptyset \subseteq P(X), \bigcup \emptyset = U} \bigwedge_{V \in \emptyset} \beta_P^X(V) - \bigvee_{\emptyset \subseteq P(X), \bigcup \emptyset = f(U)} \bigwedge_{W \in \emptyset} \sigma_P(W) \\
&\leq \bigvee_{\emptyset \subseteq P(X), \bigcup \emptyset = U} \bigwedge_{V \in \emptyset} \beta_P^X(V) - \bigvee_{\emptyset \subseteq P(X), \bigcup \emptyset = f(U)} \bigwedge_{V \in \emptyset} \sigma_P(f(V)) \\
&\leq \bigvee_{\emptyset \subseteq P(X), \bigcup \emptyset = U} \bigwedge_{V \in \emptyset} (\beta_P^X(V) - \sigma_P(f(V))), \min(1, 1 - \tau_P(U) + \sigma_P(f(U))) \\
&\geq \bigvee_{\emptyset \subseteq P(X), \bigcup \emptyset = U} \bigwedge_{V \in \emptyset} \min(1, 1 - \beta_P^X(V) + \sigma_P(f(V))) \\
&\geq [\forall V \in \beta_P^X \rightarrow f(V) \in \sigma_P].
\end{align*}
\]

Lemma 3.2 For any family \(\{(X_s, \tau_s) : s \in S\}\) of fuzzifying topological spaces.

(1) \(\vDash (\forall s)(s \in S \rightarrow p_s \in O_P)\);  
(2) \(\vDash (\forall s)(s \in S \rightarrow p_s \in C_P)\).
\textbf{Proof.} (1) For any $t \in S$, we have
\[
O_{P}(p_{t}) = \bigwedge_{U \in P(\prod_{s \in S} X_{s})} \min(1, 1 - \left( \prod_{s \in S} (\tau_{P})_{s}(U) + (\tau_{P})_{t}(p_{t}(U)) \right)).
\]
Then it suffices to show that for any $U \in P(\prod_{s \in S} X_{s})$, we have
\[
(\tau_{P})_{t}(p_{t}(U)) \geq \left( \prod_{s \in S} (\tau_{P})_{s}(U) \right).
\]
Assume
\[
\left( \prod_{s \in S} (\tau_{P})_{s}(U) \right) = \bigvee_{\lambda \in \Lambda} \bigwedge_{s \in S} (\tau_{P})_{s}(V_{s}) > \mu
\]
where
\[
\Phi_{\lambda} = \{ p_{s}^{-1}(V_{s}) : s \in S(\Phi_{\lambda}) \} (\lambda \in \Lambda).
\]
Hence there exists $\{ B_{\lambda} : \lambda \in \Lambda \} \subseteq P(\prod_{s \in S} X_{s})$ such that $\bigcup_{\lambda \in \Lambda} B_{\lambda} = U$ and furthermore, for any $\lambda \in \Lambda$, there exists $\Phi_{\lambda} \in \varphi$ such that $\cap_{\lambda \in \Lambda} \Phi_{\lambda} = B_{\lambda}$ and $\bigcap_{s \in S(\Phi_{\lambda})} p_{s}^{-1}(V_{s}) = B_{\lambda}$, where for any $s \in S(\Phi_{\lambda})$ we have $(\tau_{P})_{s}(V_{s}) > \mu$. Thus
\[
p_{t}(U) = p_{t}(\bigcup_{\lambda \in \Lambda} \bigcap_{s \in S(\Phi_{\lambda})} p_{s}^{-1}(V_{s})).
\]
(1) If for any $\lambda \in \Lambda$, $\bigcap_{s \in S(\Phi_{\lambda})} p_{s}^{-1}(V_{s}) = \phi$, then $U = \phi$, $p_{t}(U) = \phi$ and $(\tau_{P})_{t}(p_{t}(U)) = 1$. Therefore
\[
(\tau_{P})_{t}(p_{t}(U)) \geq \left( \prod_{s \in S} (\tau_{P})_{s}(U) \right).
\]
(2) If there exists $\lambda_{0} \in \Lambda$, such that $\phi = \bigcap_{s \in S(\Phi_{\lambda_{0}})} p_{s}^{-1}(V_{s}) = B_{\lambda_{0}}$,
(i) If $t \notin S(\Phi_{\lambda_{0}})$, i.e., $t \in S - S(\Phi_{\lambda_{0}})$, $p_{t}(B_{\lambda_{0}}) = X_{t}$. Therefore $(\tau_{P})_{t}(p_{t}(B_{\lambda_{0}})) = (\tau_{P})_{t}(X_{t}) = 1$.
(ii) If $t \in S(\Phi_{\lambda_{0}})$, then $p_{t}(B_{\lambda_{0}}) = V_{t} \subseteq X_{t}$. Thus

\[
p_{t}(U) = p_{t}(\bigcup_{t \in S(\Phi_{\lambda_{0}})} B_{\lambda_{0}}) \cup (\bigcup_{t \notin S(\Phi_{\lambda_{0}})} B_{\lambda_{0}}) = (\bigcup_{t \in S(\Phi_{\lambda_{0}})} p_{t}(B_{\lambda_{0}})) \cup (\bigcup_{t \notin S(\Phi_{\lambda_{0}})} p_{t}(B_{\lambda_{0}})) = V_{t} \cup X_{t} = X_{t}.
\]
Hence
\[
(\tau_{P})_{t}(p_{t}(U)) = (\tau_{P})_{t}(X_{t}) = 1 \text{ or } (\tau_{P})_{t}(p_{t}(U)) = (\tau_{P})_{t}(V_{t}) > \lambda.
\]
Therefore $(\tau_{P})_{t}(p_{t}(U)) \geq \left( \prod_{s \in S} (\tau_{P})_{s}(U) \right)$. Thus $O_{P}(p_{t}) = 1$.

(2) From Lemma 3.1 in [25] we have $\vdash (\forall s)(s \in S \rightarrow p_{s} \in C)$. Furthermore, for any two fuzzifying topological spaces $(X, \tau)$ and $(Y, \sigma)$ and $f \in Y^{X}$, we have $C(f) \leq C_{P}(f)$ (Theorem 6.3 in [2]). Therefore $\vdash (\forall s)(s \in S \rightarrow p_{s} \in C_{P})$. ■
Theorem 3.2 Let \( \{(X_s, \tau_s) : s \in S\} \) be the family of fuzzifying topological spaces, then
\[
\exists U(U \subseteq \prod_{s \in S} X_s \land \Gamma_p(U, \tau/U) \land \exists x(x \in \text{Int}_p(U)) \rightarrow \exists T(T \subseteq S \land \forall t(t \in S - T \land \Gamma_p(X_t, \tau_t))).
\]

Proof. It suffices to show that
\[
\bigvee_{U \in P(\prod_{s \in S} X_s)} \left( \Gamma_p(U, \tau/U) \land \bigvee_{x \in \prod_{s \in S} X_s} N^P_x(U) \right) \leq \bigvee_{T \in S} \bigcap_{t \in S - T} \Gamma_p(X_t, \tau_t).
\]
Indeed, if
\[
\bigvee_{U \in P(\prod_{s \in S} X_s)} \left( \Gamma_p(U, \tau/U) \land \bigvee_{x \in \prod_{s \in S} X_s} N^P_x(U) \right) > \mu > 0,
\]
then there exists \( U \in P(\prod_{s \in S} X_s) \) such that \( \Gamma_p(U, \tau/U) > \mu \) and \( \bigvee_{x \in \prod_{s \in S} X_s} N^P_x(U) > \mu \), where
\[
N^P_x(U) = \bigvee_{V \subseteq U} \left( \prod_{s \in S} (\tau_p)_s \right)(V).
\]
Furthermore, there exists \( V \) such that \( x \in V \subseteq U \) and \( \left( \prod_{s \in S} (\tau_p)_s \right)(V) > \mu \). Since \( \beta_p \) is a pre-base of \( \prod_{s \in S} (\tau_p)_s \),
\[
\left( \prod_{s \in S} (\tau_p)_s \right)(V) = \bigvee_{\bigcup_{s \in \Lambda} B_s = V} \bigwedge_{s \in \Lambda} \beta_p(B_s) = \bigvee_{\bigcup_{s \in \Lambda} B_s = V} \bigwedge_{s \in \Lambda} \bigvee_{\Phi_s \in \varphi, \Phi_s = B_s} \bigwedge_{s \in S(\Phi_s)} (\tau_p)_s(V_s) > \mu,
\]
where \( \Phi_s = \{ p^{-1}(V_s) : s \in S(\Phi_s) \} (\lambda \in \Lambda) \). Hence there exists \( \{B_s : s \in \Lambda\} \subseteq P(\prod_{s \in S} X_s) \) such that \( \bigcup_{s \in \Lambda} B_s = V \). Furthermore, for any \( \lambda \in \Lambda \), there exists \( \Phi_s \in \varphi \) such that \( \cap_{s \in \Lambda} \Phi_s = B_s \) and for any \( s \in S(\Phi_s) \), we have \( (\tau_p)_s(V_s) > \mu \). Since \( x \in V \), there exists \( B_{x_s} \) such that \( x \in B_{x_s} \subseteq V \subseteq U \). Hence there exists: \( \Phi_{x_s} \in \varphi \) such that \( \cap_{s \in \Lambda} \Phi_{x_s} = B_{x_s} \) and \( \bigcap_{s \in S(\Phi_{x_s})} p^{-1}(V_s) = B_{x_s} \subseteq \prod_{s \in S(\Phi_{x_s})} X_s \) and for any \( s \in S(\Phi_{x_s}) \), we have \( (\tau_p)_s(V_s) > 1 - \mu \). By \( \bigcap_{s \in S(\Phi_{x_s})} p^{-1}(V_s) = B_{x_s} \), we have \( P_\delta(B_{x_s}) = V_\delta \subseteq X_\delta \), if \( \delta \in S(\Phi_{x_s}) \); \( P_\delta(B_{x_s}) = X_\delta \), if \( \delta \in S - S(\Phi_{x_s}) \). Since \( B_{x_s} \subseteq U \), for any \( \delta \in S - S(\Phi_{x_s}) \), we have \( P_\delta(U) \supseteq P_\delta(B_{x_s}) = X_\delta \) and \( P_\delta(U) = X_\delta \). On the other hand, since for any \( s \in S \) and \( U_s \in P(X_s) \), \( \left( \prod_{t \in S} (\tau_p)_t \right)(p^{-1}(U_s)) \geq (\tau_p)_s(U_s) \), we have \( I_p(p_s) = \bigwedge_{U_s \in P(X_s)} \min(1, 1 - (\tau_p)_s(U_s) + \prod_{t \in S} (\tau_p)_t(p^{-1}(U_s))) = 1 \).
Furthermore, since by Theorem 9 in [1], we have
\[ \vdash \Gamma_P(X, \tau) \otimes I_P(f) \to \Gamma_P(f(X)), \]
then
\[ \Gamma_P(U, \tau/U) = \Gamma_P(U, \tau/U) \otimes I_P(p_\delta) \leq \Gamma_P(P_\delta(U), \tau_\delta) = \Gamma_P(X_\delta, \tau_\delta). \]
Therefore
\[ \bigvee_{T \in S} \bigwedge_{t \in S - T} \Gamma_P(X_t, \tau_t) \geq \bigwedge_{\delta \in S(S,\phi)} \Gamma_P(X_\delta, \tau_\delta) \geq \Gamma_P(U, \tau/U) > \mu. \]

\[ \checkmark \]

The above theorem is a generalization of the following corollary.

**Corollary 3.2** If there exists a coordinate pre-neighborhood strong compact subset \( U \) of some point \( x \in X \) of the product space, then all except a finite number of coordinate spaces are strong compact.

**Lemma 3.3** For any fuzzifying topological space \((X, \tau), A \subseteq X\),
\[ \vdash T_2^P(X, \tau) \to T_2^P(A, \tau/A). \]

**Proof.**
\[
[T_2^P(X, \tau)] = \bigwedge_{x \neq y} \bigvee_{U \in P(X), U \cap V = \phi} (N_x^P(U), N_y^P(V)) \\
\leq \bigwedge_{x \neq y} \bigvee_{U \in A \cap (\cap V \cap A = \phi)} (N_x^PA(U \cap A), N_y^PA(V \cap A)) \\
\leq \bigwedge_{x \neq y} \bigvee_{U \in A \cap \phi, V' \in P(A)} (N_x^PA(U'), N_y^PA(V')) \\
= T_2^P(A, \tau/A),
\]
where
\[ N_x^PA(U) = \bigvee_{x \in C \subseteq U} \tau_P/A(C) \] and \[ \tau_P/A(B) = \bigvee_{B = Y \cap A} \tau_P(V). \]

\[ \checkmark \]

**Lemma 3.4** For any fuzzifying \( P \)-topological space \((X, \tau), \)
\[ \vdash T_2^P(X, \tau) \otimes \Gamma_P(X, \tau) \to T_4^P(X, \tau). \]
For the definition of \( T_4^P(X, \tau) \) see [3, Definition 3.1].

**Proof.** If \[ [T_2^P(X, \tau) \otimes \Gamma_P(X, \tau)] = 0, \] then the result holds. Now, suppose that \[ [T_2^P(X, \tau) \otimes \Gamma_P(X, \tau)] > \lambda > 0 \]. Then \[ T_2^P(X, \tau) + \Gamma_P(X, \tau) - 1 > \lambda > 0 \]. Therefore from Theorem 10 in [1]
\[ T_2^P(X, \tau) \otimes (\Gamma_P(A) \wedge \Gamma_P(B)) \wedge (A \cap B = \phi) \vdash [\exists U \cap V = \phi, A \subseteq U, B \subseteq V \wedge (A \cap B = \phi)]. \] Then for any \( A, B \subseteq X, A \cap B = \phi, \)
\[ T_2^P(X, \tau) \otimes (\Gamma_P(A) \wedge \Gamma_P(B)) \leq \bigvee_{U \cap V = \phi, A \subseteq U, B \subseteq V} \min(\tau_P(U), \tau_P(V)). \]
or equivalently
\[ T_2^P(X, \tau) \leq \Gamma_P(A) \land \Gamma_P(B) \rightarrow \bigvee_{U \cap V = \phi, A \subseteq U, B \subseteq V} \min(\tau_P(U), \tau_P(V)) \]

Hence for any \( A, B \subseteq X, A \cap B = \phi, \)
\[ 1 - [\Gamma_P(A) \land \Gamma_P(B)] + \bigvee_{U \cap V = \phi, A \subseteq U, B \subseteq V} \min(\tau_P(U), \tau_P(V)) + \Gamma_P(X, \tau) - 1 > \lambda. \]

From Theorem 7 in [1] we have
\[ \models \Gamma_P(X, \tau) \otimes A \in F_P \rightarrow \Gamma_P(A). \]

Then
\[ \Gamma_P(X, \tau) + [\tau_P(A^c) \land \tau_P(B^c)] - 1 = (\Gamma_P(X, \tau) + \tau_P(A^c) - 1) \land (\Gamma_P(X, \tau) + \tau_P(B^c) - 1) \leq (\Gamma_P(X, \tau) \otimes \tau_P(A^c)) \land (\Gamma_P(X, \tau) \otimes \tau_P(B^c)) \leq [\Gamma_P(A) \land \Gamma_P(B)]. \]

Thus
\[ \Gamma_P(X, \tau) - [\Gamma_P(A) \land \Gamma_P(B)] - 1 \leq -[\tau_P(A^c) \land \tau_P(B^c)] \]

So,
\[ 1 - [\tau_P(A^c) \land \tau_P(B^c)] + \bigvee_{U \cap V = \phi, A \subseteq U, B \subseteq V} \min(\tau_P(U), \tau_P(V)) > \lambda, \]
i.e.,
\[ T_4^P(X, \tau) = \bigwedge_{A \cap B = \phi} \min(1, 1 - [\tau_P(A^c) \land \tau_P(B^c)]) + \bigvee_{U \cap V = \phi, A \subseteq U, B \subseteq V} \min(\tau_P(U), \tau_P(V))) > \lambda. \]

The above lemma is a generalization of the following corollary.

**Corollary 3.3** Every strong compact pre-Hausdorff topological space is pre-normal.

**Lemma 3.5** For any fuzzifying \( P \)-topological space \((X, \tau)\),
\[ \models T_2^P(X, \tau) \otimes \Gamma_P(X, \tau) \rightarrow T_3^P(X, \tau). \] For the definition of \( T_3^P(X, \tau) \) see [3, Definition 3.1].

**Proof.** Immediate, set \( A = \{x\} \) in the above lemma. ■

The above lemma is a generalization of the following corollary.

**Corollary 3.4** Every strong compact pre-Hausdorff topological space is pre-regular.

**Theorem 3.3** For any fuzzifying topological space \((X, \tau)\) and \( A \subseteq X, \)
\[ \models T_2^P(X, \tau) \otimes \Gamma_P(A) \rightarrow A \in F_P. \]
Proof. For any $\{x\} \subset A^c$, we have $\{x\} \cap A = \phi$ and $\Gamma_P(\{x\}) = 1$. By Theorem 10 in [1]

$$[T^P_2(X, \tau) \otimes (\Gamma_P(A) \land \Gamma_P(\{x\}))] \leq \bigvee_{G \cap H_x = \phi, A \subseteq G, x \in H_x} \min(\tau_P(G), \tau_P(H_x)) \cdot$$

Assume

$$\beta_x = \{H_x : A \cap H_x = \phi, x \in H_x\}, \bigcup_{x \in X \setminus A} f(x) \supseteq A^c$$

and

$$\bigcup_{f(x) \cap A} A = \bigcup_{f(x) \cap A} (f(x) \cap A) = \phi.$$

So, $\bigcup_{x \in A^c} f(x) = A^c$.

Therefore

$$[T^P_2(X, \tau) \otimes \Gamma_P(A)] \leq \bigvee_{G \cap H_x = \phi, A \subseteq G, x \in H_x} \tau_P(H_x)$$

$$\leq \bigwedge_{x \in A^c} \bigvee_{A \cap H_x = \phi, x \in H_x} \tau_P(H_x)$$

$$= \bigvee_{f \in \prod_{x \in A^c} \beta_x} \bigwedge_{x \in A^c} \tau_P(f(x))$$

$$\leq \bigvee_{f \in \prod_{x \in A^c} \beta_x} \tau_P(\bigcup_{x \in A^c} f(x))$$

$$= \bigvee_{f \in \prod_{x \in X \setminus A} \beta_x} \tau_P(A^c) = F_P(A).$$

The above theorem is a generalization of the following corollary.

**Corollary 3.5** Strong compact subspace of a pre-Hausdorff topological space is pre-closed.

### 4 Fuzzifying locally strong compactness

**Definition 4.1** Let $\Omega$ be a class of fuzzifying topological spaces. A unary fuzzy predicate $L_P C : \Omega \to [0, 1]$, called fuzzifying locally strong compactness, is given as follows:

$$(X, \tau) \in L_P C := (\forall x)(\exists B)((x \in \text{Int}_P(B) \otimes \Gamma_P(B, \tau/B)).$$

Since $[x \in \text{Int}_P(X)] = N^P_x(X) = 1$, then $L_P C(X, \tau) \geq \Gamma_P(X, \tau)$. Therefore, $\models (X, \tau) \in \Gamma_P \rightarrow (X, \tau) \in L_P C$.

Also, since $\models (X, \tau) \in \Gamma \rightarrow (X, \tau) \in LC$ [21] and $\models (X, \tau) \in \Gamma_P \rightarrow (X, \tau) \in \Gamma$ [1], $\models (X, \tau) \in \Gamma_P \rightarrow (X, \tau) \in LC$.

**Theorem 4.1** For any fuzzifying topological space $(X, \tau)$ and $A \subseteq X$, $\models (X, \tau) \in L_P C \otimes A \in F_P \rightarrow (A, \tau/A) \in L_P C.$
Proof. We have

\[ L_P C(X, \tau) = \bigwedge_{x \in X} \bigvee_{B \subseteq X} \max(0, N^P_X(B) + \Gamma_P(B, \tau/B) - 1) \]

and

\[ L_P C(A, \tau/A) = \bigwedge_{x \in A} \bigvee_{G \subseteq A} \max(0, N^P_X(G) + \Gamma_P(G, (\tau/A)/G) - 1). \]

Now, suppose that \([X, \tau] \in L_P C \otimes A \in F_P]\) > \(\lambda > 0\). Then for any \(x \in A\), there exists \(B \subseteq X\) such that

\[ N^P_X(B) + \Gamma_P(B, \tau/B) + \tau_P(X - A) - 2 \geq \lambda \] \(\text{(1)}\)

Set \(E = A \cap B \in P(A)\). Then

\[ N^P_X(E) = \bigvee_{E = C \cap B} N^P_X(C) \geq N^P_X(B) \]

and for any \(U \in P(E)\), we have

\[ (\tau_P/A)_{P/E}(U) = \bigvee_{U = C \cap E} \tau_P/A(C) \]

\[ = \bigvee_{U = C \cap E} \bigvee_{C = D \cap A} \tau_P(D) \]

\[ = \bigvee_{U = D \cap A} \tau_P(D) = \bigvee_{U = D \cap E} \tau_P(D). \]

Similarly,

\[ (\tau_P/B)_{P/E}(U) = \bigvee_{U = D \cap E} \tau_P(D). \]

Thus, \((\tau_P/B)_{P/E} = (\tau_P/A)_{P/E}\) and \(\Gamma_P(E, (\tau/A)/E) = \Gamma_P(E, (\tau/B)/E)\). Furthermore,

\[ [E \in F_P/B] = \tau_P/B(B - E) = \tau_P/B(B \cap E^c) \]

\[ = \bigvee_{B \cap E^c = B \cap D} \tau_P(D) \]

\[ \geq \tau_P(X - A) = F_P(A). \]

Since \(\models (X, \tau) \in \Gamma_P \otimes A \in F_P \rightarrow (A, \tau/A) \in \Gamma_P\) (see [1], Theorem 7], from (1) we have for any \(x \in A\) that

\[ \bigvee_{G \subseteq A} \max(0, N^P_X(G) + \Gamma_P(G, (\tau/A)/G) - 1) \geq N^P_X(E) + \Gamma_P(E, (\tau/A)/E) - 1 \]

\[ = N^P_X(E) + \Gamma_P(E, (\tau/B)/E) - 1 \]

\[ \geq N^P_X(B) + [\Gamma_P(B, \tau/B) \otimes E \in F_P/B] - 1 \]

\[ \geq N^P_X(B) + \Gamma_P(B, \tau/B) + [E \in F_P/B] - 2 \]

\[ \geq N^P_X(B) + \Gamma_P(B, \tau/B) + [A \in F_P] - 2 > \lambda. \]
Therefore

\[ L_P C(A, \tau/A) = \bigwedge_{x \in A} \bigvee_{G \subseteq A} \max(0, N_x^{P_A}(G) + \Gamma_P(G, (\tau/A)/G) - 1) > \lambda. \]

Hence \([(X, \tau) \in L_P C \otimes A \in F_P] \leq L_P C(A, \tau/A). \]

As a crisp result of the above theorem we have the following corollary.

**Corollary 4.1** Let \( A \) be a pre-closed subset of locally strong compact space \((X, \tau)\). Then \( A \) with the relative topology \( \tau/A \) is locally strong compact.

The following theorem is a generalization of the statement ”If \( X \) is a pre-Hausdorff topological space and \( A \) is a pre-dense locally strong compact subspace, then \( A \) is pre-open”, where \( A \) is a pre-dense in a topological space \( X \) if and only if the pre-closure of \( A \) is \( X \).

**Theorem 4.2** For any fuzzifying \( P \)-topological space \((X, \tau)\) and \( A \subseteq X \),

\[ \equiv T_2^{P}(X, \tau) \otimes L_P C(A, \tau/A) \otimes (Cl_P(A) \equiv X) \rightarrow A \in \tau_P. \]

**Proof.** Assume

\[ [T_2^{P}(X, \tau) \otimes L_P C(A, \tau/A) \otimes (Cl_P(A) \equiv X)] > \lambda > 0. \]

Then

\[ L_P C(A, \tau/A) > \lambda - [T_2^{P}(X, \tau) \otimes (Cl_P(A) \equiv X)] + 1 = \lambda' > \lambda \]

i.e.,

\[ \bigwedge_{x \in A} \bigvee_{B \subseteq A} \max(0, N_x^{P_A}(B) + \Gamma_P(B, (\tau/A)/B) - 1) > \lambda'. \]

Thus for any \( x \in A \), there exists \( B_x \subseteq A \) such that

\[ N_x^{P_A}(B_x) + \Gamma_P(B_x, (\tau/A)/B_x) - 1 > \lambda'. \]

i.e.,

\[ \bigvee_{H \cap A = B_x} \bigvee_{x \in K \subseteq H} \tau_P(K) + \Gamma_P(B_x, (\tau/A)/B_x) - 1 > \lambda'. \]

Hence there exists \( K_x \) such that

\[ K_x \cap A = B_x, \tau_P(K_x) + \Gamma_P(B_x, (\tau/A)/B_x) - 1 > \lambda'. \]

Therefore \( \tau_P(K_x) > \lambda' \).

(1) If for any \( x \in A \) there exists \( K_x \) such that

\[ x \in K_x \subseteq B_x \subseteq A, \text{ then } \bigcup_{x \in A} K_x = A \]

and

\[ \tau_P(A) = \tau_P\left(\bigcup_{x \in A} K_x\right) \geq \bigwedge_{x \in A} \tau_P(K_x) \geq \lambda' > \lambda. \]

(2) If there exists \( x_o \in A \) such that

\[ K_{x_o} \cap (B_{x_o}^c) \neq \phi, \tau_P(K_{x_o}) + \Gamma_P(B_{x_o}, (\tau/A)/B_{x_o}) - 1 > \lambda'. \]
From the hypothesis
\[ T_2^p(X, \tau) \otimes L_p C(A, \tau/A) \otimes (Cl_p(A) \equiv X) > \lambda > 0, \]
we have \[ T_2^p(X, \tau) \otimes (Cl_p(A) \equiv X) \neq 0. \] So
\[ \tau_p(K_{x_0}) + \Gamma_p(B_{x_0}, (\tau/A)/B_{x_0}) - 1 + [T_2^p(X, \tau) \otimes (Cl_p(A) \equiv X)] - 1 > 0. \]
Therefore
\[ \tau_p(K_{x_0}) + \Gamma_p(B_{x_0}, (\tau/A)/B_{x_0}) - 1 + T_2^p(X, \tau) + [(Cl_p(A) \equiv X)] - 1 - 1 > \lambda. \]
Since
\[ (\tau_p/A)_p/B_{x_0}(U) = \bigvee_{U \in C \cap B_{x_0}} \tau_p/A(C) \]
\[ = \bigvee_{U \in C \cap B_{x_0}} \bigvee_{C = D \cap A} \tau_p(D) \]
\[ = \bigvee_{U \in D \cap B_{x_0}} \tau_p(D) = \tau_p/B_{x_0}(U), \]
From Theorem 3.3 we have
\[ \tau_p(B_{x_0}^c) \geq T_2^p(X, \tau) \otimes \Gamma_p(B_{x_0}, \tau/B_{x_0}) \]
\[ \geq T_2^p(X, \tau) + \Gamma_p(B_{x_0}, \tau/B_{x_0}) - 1. \]
Hence
\[ \tau_p(K_{x_0}) + \tau_p(B_{x_0}^c) + [Cl_p(A) \equiv X] - 2 > \lambda. \]
Now, for any \( y \in A^c \) we have
\[ [Cl_p(A) \equiv X] = \bigwedge_{x \in X} (1 - N_x^{p_x}(A^c)) \leq 1 - N_y^{p_x}(A^c). \]
Since \((X, \tau)\) is a fuzzifying \(P\)-topological space,
\[ \tau_p(K_{x_0}) + \tau_p(B_{x_0}^c) - 1 \leq \tau_p(K_{x_0}) \otimes \tau_p(B_{x_0}^c) \]
\[ \leq \tau_p(K_{x_0}) \wedge \tau_p(B_{x_0}^c) \]
\[ \leq \tau_p(K_{x_0} \cap B_{x_0}^c) \]
\[ \leq N_y^{p_x}(K_{x_0} \cap B_{x_0}^c) \leq N_y^{p_x}(A^c), \]
where
\[ y \in K_{x_0} \cap B_{x_0}^c \subseteq H_{x_0} \cap (H_{x_0} \cap A)^c = H_{x_0} \cap (H_{x_0}^c \cup A^c) = H_{x_0} \cap A^c \subseteq A^c. \]
Therefore
\[ 0 < \lambda < \tau_p(K_{x_0}) + \tau_p(B_{x_0}^c) + [Cl_p(A) \equiv X] - 2 = \tau_p(K_{x_0}) + \tau_p(B_{x_0}^c) - 1 + [Cl_p(A) \equiv X] - 1 \]
\[ \leq N_y^{p_x}(A^c) + 1 - N_y^{p_x}(A^c) - 1 = 0, \]
a contradiction. So, case (2) does not hold. We complete the proof.
Theorem 4.3 For any fuzzifying $P$-topological space $(X, \tau),$

$$\forall \tau \in T_2^P(X) \otimes (L_P C(X, \tau))^2 \rightarrow \forall x \forall U(U \in N_x^P \rightarrow \exists V(V \in N_x^P \wedge C \cap P(V) \subseteq U \wedge \Gamma_P(V))).$$

where $(L_P C(X, \tau))^2 := L_P C(X, \tau) \otimes L_P C(X, \tau).$

Proof. We need to show that for any $x$ and $U, x \in U,$

$$T_2^P(X, \tau) \otimes (L_P C(X, \tau))^2 \otimes N_x^P(U) \leq \bigvee_{V \subseteq X} (N_x^P(V) \wedge \bigwedge_{y \in U^c} N_x^P(V^c \wedge \Gamma_P(V, \tau/V))).$$

Assume that $T_2^P(X, \tau) \otimes (L_P C(X, \tau))^2 \otimes N_x^P(U) > \lambda > 0.$ Then for any $x \in X$ there exists $C$ such that

$$T_2^P(X, \tau) + N_x^P(C) + (L_P C(X, \tau))^2 + N_x^P(U) > 3 \lambda. \quad (2)$$

Since $(X, \tau)$ is fuzzifying $P$-topological space,

$$N_x^P(C) + N_x^P(U) \leq N_x^P(C) \otimes N_x^P(U) \leq N_x^P(C \cap U) = \bigvee_{x \in W \subseteq C \cap U} \tau_P(W).$$

Therefore there exists $W$ such that $x \in W \subseteq C \cap U,$ and $T_2^P(X, \tau) + (L_P C(X, \tau))^2 + \tau_P(W) - 2 > \lambda.$ By Lemmas 3.3 and 3.5 we have $T_2^P(X, \tau) \leq T_2^P(C, \tau/C)$ and

$$T_2^P(C, \tau/C) + \Gamma_P(C, \tau/C) - 1 \leq T_2^P(C, \tau/C) \otimes \Gamma_P(C, \tau/C) \leq T_3^P(C, \tau/C).$$

Thus $T_3^P(X, \tau) + \Gamma_P(C, \tau/C) + \tau_P(W) - 2 > \lambda.$ Since for any $x \in W \subseteq U,$ we have

$$T_3^P(C, \tau/C) \leq 1 - \tau_P/C(W) + \bigvee_{G \subseteq C} \left( (N_x^{PC}(G) \wedge \bigwedge_{y \in C-W} N_y^{PC}(C - G)) \right),$$

so there exists $G, x \in G \subseteq W$ such that

$$\left( (N_x^{PC}(G) \wedge \bigwedge_{y \in C-W} N_y^{PC}(C - G)) \right) \geq T_3^P(C, \tau/C) + \tau_P/C(W) - 1 \geq T_3^P(C, \tau/C) + \tau_P(W) - 1$$

and

$$\left( (N_x^{PC}(G) \wedge \bigwedge_{y \in C-W} N_y^{PC}(C - G)) \right) + \Gamma_P(C, \tau/C) - 1 > \lambda.$$

Thus

$$N_x^{PC}(G) = \bigvee_{D \cap C = G} N_x^P(D) = N_x^P(G \cup C^c) \geq \lambda' = \lambda + 1 - \Gamma_P(C, \tau/C) \geq \lambda.$$

Furthermore, for any $y \in C - W,$

$$N_y^{PC}(C - G) = \bigvee_{D \cap C = G} N_y^P(G^c \cup C^c) = N_y^P(G^c) > \lambda'.$$

21
and 
\[ N_x^{px} (G) = N_x^{px} ((G \cup C) \cap C) \geq N_x^{px} (G \cup C^c) \wedge N_x^{px} (C) > \lambda'. \]

Since \( N_y^{px} (G^c) = \bigvee_{x \in B^c \subseteq C^c} \tau_p(B^c) > \lambda' \), for any \( y \in C - W \), there exists \( B^c_y \) such that \( y \in B^c_y \subseteq G^c \) and \( \tau_p(B^c_y) > \lambda' \). Set \( B^c = \bigcup_{y \in C - W} B^c_y \). Then \( C - W \subseteq B^c \subseteq G^c \) and

\[ \tau_p(B^c) \geq \bigwedge_{y \in C - W} \tau_p(B^c_y) \geq \lambda'. \]

Again, set \( V = B \cap C \), then \( V \subseteq (C - W)^c \cap C = (C^c \cup W) \cap C = C \cap W = W \subseteq U \cap C \) and \( V^c = B^c \cup C^c \). Since \((X, \tau)\) is fuzzifying \( P \)-topological space,

\[ N_x^{px} (V) = N_x^{px} (B \cap C) \geq N_x^{px} (B) \wedge N_x^{px} (C) \geq N_x^{px} (G) \wedge N_x^{px} (C) > \lambda. \tag{3} \]

By (3) and Theorem 3.3,

\[ \tau_p(C^c) \geq T_2^p(X, \tau) \otimes \Gamma_p(C, \tau/C) \geq T_2^p(X, \tau) + \Gamma_p(C, \tau/C) - 1 \geq \lambda'. \]

So

\[ \tau_p(V^c) = \tau_p(B^c \cup C^c) \geq \tau_p(B^c) \wedge \tau_p(C^c) \geq \lambda', \]

i.e., \( \tau_p(V^c) + \Gamma_p(C, \tau/C) - 1 \geq \lambda \) and

\[ \Gamma_p(V, \tau/V) = \Gamma_p(V, (\tau/C)/V) \geq \tau_p/C(C - V) + \Gamma_p(C, \tau/C) - 1 \geq \tau_p(V^c) + \Gamma_p(C, \tau/C) - 1 \geq \lambda \tag{4} \]

Finally,

\[ \bigwedge_{y \in U^c} N_y^{px} (V^c) \geq \bigwedge_{y \in V^c} N_y^{px} (V^c) = \tau_p(V^c) \geq \lambda \] \tag{5}

Thus by (3), (4) and (5), for any \( x \in U \), there exists \( V \subseteq U \) such that \( N_x^{px} (V) > \lambda \), \( \bigwedge_{y \in U^c} N_y^{px} (V^c) \geq \lambda \) and \( \Gamma_p(V, \tau/V) \geq \lambda \). So \( \bigvee_{V \subseteq X} (N_x^{px} (V) \wedge \bigwedge_{y \in U^c} N_y^{px} (V^c) \wedge \Gamma_p(V, \tau/V)) \geq \lambda \). \( \blacksquare \)

**Theorem 4.4** For any fuzzifying \( P \)-topological space \((X, \tau)\),

\[ \equiv T_2^p(X, \tau) \otimes (L_pC(X, \tau))^2 \rightarrow T_3^p(X, \tau). \]

**Proof.** By Theorem 4.3, for any \( x \in U \), we have

\[ \bigvee_{x \in V \subseteq U} (N_x^{px} (V) \wedge \bigwedge_{y \in U^c} N_y^{px} (V^c) \geq [T_2^p(X, \tau) \otimes (\Gamma_p(C, \tau/C))^2 \otimes N_x^{px} (U)]. \]

Thus

\[ 1 - N_x^{px} (U) + \bigvee_{x \in V \subseteq U} (N_x^{px} (V) \wedge \bigwedge_{y \in U^c} N_y^{px} (V^c) \geq [T_2^p(X, \tau) \otimes (\Gamma_p(C, \tau/C))^2], \]

i.e.,

\[ [T_3^p(X, \tau)] \geq [T_2^p(X, \tau) \otimes (\Gamma_p(C, \tau/C))^2]. \]

\( \blacksquare \)
Theorem 4.5 For any fuzzifying $P$-topological space $(X, \tau)$,
\[
\mathcal{N}^P_{A}(X, \tau) \otimes L(PC(X, \tau) \otimes \Gamma_P(A, \tau/A)) 
\rightarrow \exists V(V \subseteq U \wedge U \subseteq N^P_{A}(X, \tau) \otimes \tau_P(V^C) \wedge \Gamma_P(V, \tau/V)),
\]
where
\[
U \subseteq N^P_{A} := (\forall x)(x \in A \wedge U \subseteq N^P_{x}).
\]
Proof. We only need to show that for any $A, U \in P(X)$,
\[
[T^P_3(X, \tau) \otimes L(PC(X, \tau) \otimes \Gamma_P(A, \tau/A) \otimes N^P_{A}(U)) \leq \bigvee_{V \subseteq U} (N^P_{A}(V) \wedge \tau_P(V^C) \wedge \Gamma_P(V, \tau/V)).
\]
Indeed, if
\[
[T^P_3(X, \tau) \otimes L(PC(X, \tau) \otimes \Gamma_P(A, \tau/A) \otimes N^P_{A}(U)] > \lambda > 0,
\]
then for any $x \in A$, there exists $C \in P(X)$ such that
\[
[T^P_3(X, \tau) \otimes N^P_{x}(C) \otimes \Gamma_P(C, \tau/C) \otimes \Gamma_P(A, \tau/A) \otimes N^P_{A}(U)] > \lambda.
\]
Since $(X, \tau)$ is fuzzifying $P$-topological space,
\[
\bigvee_{x \in W \subseteq C \cap U} \tau_P(W) = N^P_{x}(C \cap U) \geq N^P_{x}(C) \wedge N^P_{x}(U) \geq N^P_{x}(C) \wedge N^P_{A}(U) \geq N^P_{x}(C) \otimes N^P_{A}(U).
\]
Then there exists $W$ such that $x \in W \subseteq C \cap U$, and
\[
[T^P_3(X, \tau) \otimes \tau_P(W) \otimes \Gamma_P(C, \tau/C) \otimes \Gamma_P(A, \tau/A)] > \lambda.
\]
Therefore
\[
[T^P_3(X, \tau) + \tau_P(W) - 1 > \lambda + 2 - \Gamma_P(C, \tau/C) - \Gamma_P(A, \tau/A)] = \lambda' \geq \lambda. \tag{6}
\]
Since for any $x \in W$,
\[
[T^P_3(X, \tau)] \leq 1 - \tau_P(W) + \bigvee_{B \subseteq W} (N^P_{x}(B) \wedge \bigwedge_{y \in W^c} N^P_{y}(B^C)),
\]
we have
\[
\bigvee_{B \subseteq W} (N^P_{x}(B) \wedge \bigwedge_{y \in W^c} N^P_{y}(B^C)) > \lambda'.
\]
Thus there exists $B_x$ such that $x \in B_x \subseteq W \subseteq C \cap U$ and for any $y \in W^c$, we have
\[
N^P_{y}(B_x^c) > \lambda', \quad N^P_{x}(B_x) > \lambda'.
\]
Since
\[
N^P_{y}(B_x^c) = \bigvee_{x \in G^c \subseteq B_x^c} \tau_P(G^c) > \lambda',
\]
23
then for any $y \in W^c$, there exists $G_{xy}$ such that
\[ x \in G_{xy}^c \subseteq B_x^c \text{ and } \tau_p(G_{xy}^c) > \lambda'. \]

Set
\[ G_x^c = \bigcup_{y \in W^c} G_{xy}^c, \]
then $W^c \subseteq G_x^c \subseteq B_x^c$ and $\tau_p(G_x^c) \geq \bigwedge_{y \in W^c} \tau_p(G_{xy}^c) \geq \lambda'$. Since $G_x \supseteq B_x$, $N_x^{P^X}(G_x) \geq N_x^{P^X}(B_x) > \lambda'$, i.e., $\bigvee_{x \in H \subseteq G_x} \tau_p(H) > \lambda'$. Thus there exists $H_x$ such that $x \in H_x \subseteq G_x$ and $\tau_p(H_x) > \lambda'$. Hence for any $x \in A$, there exists $H_x$ and $G_x$ such that $x \in H_x \subseteq G_x \subseteq U$, $\tau_p(H_x) > \lambda'$ and $W \supseteq \bigcup_{x \in A} G_x \supseteq \bigcup_{x \in A} H_x \supseteq A$. We define $\Re \in \mathcal{S}(P(A))$ as follows:
\[ \Re(D) = \begin{cases} \bigvee_{H_x \cap A = D} \tau_p(H_x), & \text{there exists } H_x \text{ such that } H_x \cap A = D, \\ 0, & \text{otherwise} \end{cases} \]

Let $\Gamma_{p}(A, \tau/A) = \mu > \mu - \epsilon(\epsilon > 0)$. Then $1 - K_p(\Re, A) + \bigvee_{\varphi \leq \Re} [K(\Re, A) \otimes FF(\varphi)] > \mu - \epsilon$,
where
\[ [K(\Re, A)] = \bigwedge_{x \in A} \bigvee_{x \in B} \Re(B) = \bigwedge_{x \in A} \bigvee_{x \in D} \Re(D) = \bigwedge_{x \in A} \bigvee_{x \in D} \bigwedge_{H_x \cap A = D} \tau_p(H_x) \geq \lambda'. \]

and $[\Re \leq \tau_p \setminus A] = \bigwedge_{B \subseteq X} \min(1, 1 - \tau(B) + \tau_p \setminus A(B))$ as follows:
\[ \bigwedge_{B \subseteq X} \tau_p(B) + \bigvee_{H_y \cap A = B} \tau_p(H_y) = 1. \]

So, $K_p(\Re, A) = [K(\Re, A)] \geq \lambda'$. By (*),
\[ [K(\Re, A) \otimes FF(\varphi)] > \mu - \epsilon - 1 + K_p(\Re, A) \geq \mu - \epsilon - 1 + \lambda' \geq \lambda - \epsilon. \]

Thus $\bigwedge_{x \in A} \bigvee_{x \in E} \Re(E) + 1 - \bigwedge \{\delta : F(\varphi_\delta)\} - 1 > \lambda - \epsilon$ and $\bigwedge_{x \in A} \bigvee_{x \in E} \Re(E) > \lambda - \epsilon + \bigwedge \{\delta : F(\varphi_\delta)\}$. Hence there exists $\beta > 0$ such that $F(\varphi_\beta)$ and $\bigwedge_{x \in A} \bigvee_{x \in E} \Re(D) > \lambda - \epsilon + \beta$. Therefore for any $x \in A$, there exists $D_x \subseteq A$ such that $\varphi(D_x) > \lambda - \epsilon + \beta$ and $\bigcup_{x \in A} D_x \supseteq A$. Suitable choose $\epsilon$ such that $\lambda - \epsilon > 0$, then $\varphi(D_x) > \beta > 0$. Since $\Re(D_x) \geq \varphi(D_x) > 0$, $D_x = H_x \cap A$, i.e., $H_x \cap A \in \varphi_\beta$. By $F(\varphi_\beta)$, so there exists finite $H_{x_1}', H_{x_2}', \ldots, H_{x_n}'$, such that $\bigcup_{i=1}^n H_{x_i}' \supseteq A$ and $\bigcup_{i=1}^n H_{x_i}' \subseteq \bigcup_{i=1}^n G_{x_i}'$. Set $V = \bigcup_{i=1}^n G_{x_i}'$, and $V^c = \bigcap_{i=1}^n G_{x_i}'$, $A \subseteq V \subseteq U$, and $\tau_p(V^c) \geq \bigwedge_{1 \leq i \leq n} \tau_p(G_{x_i}') \geq \lambda' > \lambda$. Since for any $x \in A$, $G_x \subseteq W \subseteq C \cap U \subseteq C$, we have $V = \bigcup_{1 \leq i \leq n} G_{x_i}' \subseteq W \subseteq C$. Because $\tau_p \setminus C(C - V) = \bigvee_{D \cap C = C \cap V} \tau_p(D) \geq \tau_p(V^c) \geq \lambda'$. Thus by Theorem 5.1 in [21], $\Gamma_p(V, \tau/V) = \Gamma_p(V, \tau/C/V) \geq [\Gamma_p(C, \tau/C) \otimes \tau_p](C - V) > \lambda$.

Finally, we have for any $x \in A$,
\[ N_{x}^{P^X}(V) = N_{x}^{P^X} \left( \bigcup_{1 \leq i \leq n} G_{x_i}' \right) \geq N_{x}^{P^X}( \bigcup_{1 \leq i \leq n} H_{x_i}' ) \geq \bigwedge_{1 \leq i \leq n} \tau_p(H_{x_i}') \geq \lambda' > \lambda. \]

So
\[ N_{x}^{P^X}(V) = \bigwedge_{x \in A} N_{x}^{P^X}(V) \geq \lambda. \]

Therefore $N_{x}^{P^X}(V) \wedge \tau_p(V^c) \wedge \Gamma_p(V, \tau/V) \geq \lambda.$
Theorem 4.6 Let \((X, \tau)\) and \((Y, \sigma)\) be two fuzzifying topological space and \(f \in Y^X\) be surjective. Then \(\forall L_P C(X, \tau) \otimes C_P(f) \otimes O(f) = L_P C(Y, \sigma)\). For the definition of \(O(f)\), see [25].

Proof. If \([L_P C(X, \tau) \otimes C_P(f) \otimes O(f)] > \lambda > 0\), then for any \(x \in X\), there exists \(U \subseteq X\), such that \([N^x_x(U) \otimes \Gamma_P(U, \tau/U) \otimes C_P(f) \otimes O(f)] > \lambda\). Since \(N^x_x(U) = \bigvee_{x \in V \subseteq U} \tau_P(V)\), so there exists \(V' \subseteq X\) such that \(x \in V' \subseteq U\) and \([\tau_P(V') \otimes \Gamma_P(U, \tau/U) \otimes C_P(f) \otimes O(f)] > \lambda\). By Theorem 8 in [1], \([\Gamma_P(U, \tau/U) \otimes C_P(f)] \leq [\Gamma(f(U), \sigma/f(U))]\) and \([\tau(V') \otimes O(f)] = \max(0, \tau(V') + O(f) - 1)\)

\[ \leq \max(0, \tau(V') + 1 - \tau(V') + \sigma(f(V))) - 1 \]

\[ = \sigma(f(V)) \leq N^x_x(f(V')) \leq N^x_x(f(U)). \]

Since \(f\) is surjective, \(L_P C(Y, \sigma) = L_P C(f(X), \sigma) = \bigwedge_{y \in f(x) \subseteq f(X)} \bigvee_{U' = f(U) \subseteq f(X)} \bigl[ N^x_x(U') \otimes \Gamma(U', \sigma/U') \bigr] \geq \bigwedge_{y \in f(x) \subseteq f(X)} \bigl[ N^x_x(f(U)) \otimes \Gamma(f(U), \sigma/f(U)) \bigr] \geq \bigwedge_{y \in f(x) \subseteq f(X)} \bigl[ \tau(V') \otimes O(f) \otimes \Gamma_P(U, \tau/U) \otimes C_P(f) \bigr] \geq \lambda. \]

Theorem 4.7 Let \((X, \tau)\) and \((Y, \sigma)\) be two fuzzifying topological space and \(f \in Y^X\) be surjective. Then \(\forall L_P C(X, \tau) \otimes I_P(f) \otimes O_P(f) = L_P C(Y, \sigma)\).

Proof. By Theorem 9 in [1], the proof is similar to the proof of Theorem 4.6. ■

Theorems 4.6 and 4.7 are a generalization of the following corollary.

Corollary 4.2 Let \((X, \tau)\) and \((Y, \sigma)\) be two topological space and \(f : (X, \tau) \rightarrow (Y, \sigma)\) be surjective mapping. If \(f\) is a pre-continuous (resp. pre-irresolute), open (resp. pre-open) and \(X\) is locally strong compact, then \(Y\) is locally compact (resp. locally strongly compact) space.

Theorem 4.8 Let \(\{(X_s, \tau_s) : s \in S\}\) be a family of fuzzifying topological spaces, then \(\forall L_P C(\prod_{s \in S} X_s, \prod_{s \in S} (\tau_s)) \rightarrow \forall s (s \in S \land L_P C(X_s, (\tau_s)) \land \exists \Gamma(T \subseteq S \land \forall t (t \in S - T \land \Gamma_P(X_t, \tau_t)))\).

Proof. It suffices to show that

\[ L_P C(\prod_{s \in S} X_s, \prod_{s \in S} (\tau_s)) \leq \bigwedge_{s \in S} [L_P C(X_s, (\tau_s)) \land \bigvee_{t \in S} \bigwedge_{s \in S - T} \Gamma_P(X_t, \tau_t)]. \]

From Theorem 4.7 and Lemma 3.1 we have for any \(t \in S\),

\[ L_P C(\prod_{s \in S} X_s, \prod_{s \in S} (\tau_s)) = [L_P C(\prod_{s \in S} X_s, \prod_{s \in S} (\tau_s)) \otimes C_P(p_t) \otimes O_P(p_t)] \leq L_P C(X_t, \tau_t). \]

So,

\[ \bigwedge_{t \in S - T} L_P C(X_t, \tau_t) \geq L_P C(\prod_{s \in S} X_s, \prod_{s \in S} (\tau_s)). \]
By Theorem 3.2 we have

\[
\bigvee_{T \in S} \bigwedge_{t \in S-T} \Gamma_P(X_t, \tau_t) \geq \bigvee_{U \subseteq \prod_{s \in S} X_s} \bigcap_{s \in S} (\tau_P)_s \setminus U \otimes \bigwedge_{X_s \subseteq \prod_{s \in S} X_s} N^{bX}_x(U))
\]

\[
\geq \bigvee_{U \subseteq \prod_{s \in S} X_s} \bigwedge_{X_s \subseteq \prod_{s \in S} X_s} [\Gamma_P(U, \prod_{s \in S} (\tau_P)_s \setminus U) \otimes N^{bX}_x(U))]
\]

\[
\geq \bigwedge_{X_s \subseteq \prod_{s \in S} X_s} \bigvee_{U \subseteq \prod_{s \in S} X_s} [\Gamma_P(U, \prod_{s \in S} (\tau_P)_s \setminus U) \otimes N^{bX}_x(U))]
\]

\[
= L_P C(\prod_{s \in S} X_s, \prod_{s \in S} (\tau_P)_s).
\]

Therefore

\[
L_P C(\prod_{s \in S} X_s, \prod_{s \in S} (\tau_P)_s) \leq \bigwedge_{t \in S-T} L_P C(X_t, \tau_t) \wedge \bigvee_{T \in S} \bigwedge_{t \in S-T} \Gamma_P(X_t, \tau_t)].
\]

We can obtain the following corollary in crisp setting.

**Corollary 4.3** Let \(\{X_\lambda : \lambda \in \Lambda\}\) be a family of nonempty topological spaces. If \(\prod_{\lambda \in \Lambda} X_\lambda\) is locally strong compact, then each \(X_\lambda\) is locally strong compact and all but finitely many \(X_\lambda\) are strong compact.

**Conclusion:** The present paper investigates topological notions when these are planted into the framework of Ying’s fuzzifying topological spaces (in semantic method of continuous valued-logic). It continue various investigations into fuzzy topology in a legitimate way and extend some fundamental results in general topology to fuzzifying topology. An important virtue of our approach (in which we follow Ying) is that we define topological notions as fuzzy predicates (by formulae of Lukasiewicz fuzzy logic) and prove the validity of fuzzy implications (or equivalences). Unlike the (more wide-spread) style of defining notions in fuzzy mathematics as crisp predicates of fuzzy sets, fuzzy predicates of fuzzy sets provide a more genuine fuzzification; furthermore the theorems in the form of valid fuzzy implications are more general than the corresponding theorems on crisp predicates of fuzzy sets. The main contributions of the present paper are to give characterizations of fuzzifying strong compactness. Also, we define the concept of locally strong compactness of fuzzifying topological spaces and obtain some basic properties of such spaces. There are some problems for further study:

1. One obvious problem is: our results are derived in the Lukasiewicz continuous logic. It is possible to generalize them to more general logic setting, like residuated lattice-valued logic considered in [27-28].

2. What is the justification for fuzzifying locally strong compactness in the setting of (2, L) topologies.

3. What is the justification for fuzzifying locally strong compactness in \((M, L)\)-topologies etc.
