Abstract: In order to clarify some more concepts, we start by classifying some forms of populism and visualize them as precursors of totalitarianism. It goes without saying that media control or at least media domination (especially in this recent age of digitalization) becomes important within this context, because the Turing galaxy follows essentially the development of the Gutenberg galaxy, but at the same time, quite different from the latter, it multiplies, enhances, and accelerates anonymous data pressure that alters the quality of the ongoing discourse. This is what we would like to discuss here in more detail by also asking for a possibly anthropological principle that underlies these developments.

This paper is an extended and revised version of a talk given at is4si2017, Chalmers University Göteborg, Netizens Section, in June 2017.

Keywords: discourse, communication, media, anthropology, political philosophy

1. Introduction: Preliminary Remarks & Motivation

„When I use a word“, Humpty Dumpty said in rather a scornful tone, „it means just what I choose it to mean – neither more nor less.”
„The question is“, said Alice, „whether you can make words mean so many different things.”
„The question is“, said Humpty Dumpty, „which is to be master – that’s all.”

„I stand before you as a representative of the American people to deliver a message of friendship and hope and love.“
President Trump to the 2017 Arab-Islamic-American Summit in Riyadh, Saudi Arabia.

“I love the people in this room. I love Israel. I love Israel. I’ve been with Israel so long in terms of – – I’ve received some of my greatest honors from Israel, my father before me, incredible. My daughter, Ivanka, is about to have a beautiful Jewish baby.”
Trump in AIPAC speech, 2016

„It is a great honor to be here with all of my friends. So amazing + will Never Forget!“
Trump at Yad Vashem, 2017

One point of clarification first: Sometimes it is argued that “populism” would be a misled signification, because, in principle, all politicians would have the objective to be “ populist” after all. However, this is not quite true: The average politician, in order to be re-elected, should be popular rather than populist. The former points to a politician who cares for the good of his or her electors and tries to find appropriate compromises that can be realized within the governing political discourse. While the latter points to a politician who merely pretends to care for the good of the electors by adopting topics of which he or she thinks that they are relevant for many people at the time and by reflecting these topics in ongoing discussions, independent of their precise meaning, consistency, and
possible use. In the first case, what is activated is primarily rational thinking. In the second case, what is activated is primarily emotional tendency, mainly based on socialized pre-dispositions. In the first case, political communication is essentially strategic, while in the second case, it is essentially tactical. In this sense, one is dealing with what is actually the case, the other one is dealing more with what is felt to be desirable. Obviously, the first needs reflection on facts therefore, the second needs imagination. Thus populism turns out to be apparent (feigned) popularity. Hence, we can legitimately keep the expression (populism) for the purposes of this present paper.

In order to clarify some more concepts, we start by classifying some forms of populism and visualize them as precursors of totalitarianism. Essentially, there are four main types of populism as received by the public described in the following:

Types of Populism as Precursors of Totalitarianism

- Passive Choice Behaviour According to Disposition and Public Discourse (communicated in figures of everyday speech) [and mediated bottom-up]
- Passive Choice in Elections According to Populist Propaganda (movements, parties) [bottom-up]
- Active Participation in movements and/or political parties [bottom-up]
- Active Radicalization (Ideology, Terror) [bottom-up]

We can notice here that all these types are basically organized in a bottom-up manner, and they spontaneously emerge within a set of boundary conditions reflecting the pre-dispositions available. Hence, the habitus dominating a local field (by somewhat adopting the terminology of Bourdieu’s) is responsible for the pre-dispositions of a social group, but whether or not this group selects its behaviour from the available choices (and in particular, to which degree of choice ranging from passivity to activity, from merely uttering opinions to finally damage persons) depends on the explicit structure of boundary conditions that are the outcome of the present historical evolution. The four types mentioned belong to the preparatory conditions of populism that eventually extend from local movements to the whole state and, by doing so, imply a manifold of possible transitions into some form of actual dictatorship:

From groups to institutions: nation states.

- Dictatorships already achieved [top-down]
- Democratic states on the way to dictatorship [bottom-up]

Here a top-down version as opposed to a bottom-up version signifies the final state of the given evolution. If we look around on our planet, then there are very many countries that can be classified as actual dictatorships of one or the other form, and most of them have always been in that state – as measured in terms of the experiential life-time of present (critical) observers. But also, recently, more and more countries that are more or less democratically organized tend to become dictatorships by public choice. This is not only the case in Asia, Africa, or Latin America, but also in the United States (most recently), and in the European Union. It is this second type of “nationalizing” populism which is most dangerous after all. It goes without saying that media control or at least media domination (especially in this recent age of digitalization) becomes important within this context, because the Turing galaxy follows essentially the development of the Gutenberg galaxy, but at the same time, quite different from the latter, it multiplies, enhances, and accelerates anonymous data pressure that alters the quality of the ongoing discourse. This is what we would like to discuss here in more detail by also asking for a
possibly anthropological principle that underlies these developments, independent of the exterior conditions such as the technological state of media and so forth.

2. Introductory Example Syria: A Study in Political Complexity

We shortly look at the present [as of Spring 2017] situation in Syria in order to clarify the quantitative and qualitative aspects of what we have mentioned above. In Syria, we can identify about 14 immediate actors (or agents) within a confrontation network of political interactions. Obviously, these interactions change according to rational and (apparently) irrational actions to be taken.

Following a New York Times report, we can state that on the morning of 4th April, there was a Sarin gas attack on Khan Skeikhoun. Quickly, the Assad regime was charged with being responsible for this attack. While having a meeting with King Abdullah II of Jordan and President Xi Jinping of China, US President Trump ordered a retaliation, and the Russian command on location was informed in advance on short notice. On 6th April, at 7.40 p.m., a Tomahawk missile attack on Al Sharyat airfield took place.

Despite the seemingly linear action taken (Syria attacks, the US punish), the analysis of the original incident looks much more complex:

Possibility A: Syrians have hold back Sarin gas from former times and used it then in an air strike. (Did the Russians know?)

Possibility B: Syrians have hold back Sarin gas that had been recovered by one of the rebels group which used it for producing confusion. (Then not by air strike.)

Possibility C: One of the numerous other (rebel) groups produced Sarin gas and used it. (Ditto. And could they actually achieve this?)

Possibility D: Turkey provided Al Nusra with Sarin gas who used it then, but not by air strike. (Remember the case of Can Dündar.)

[to be continued …]

What we notice is that it is virtually impossible to clarify the case completely, mainly, because the number of un-re-assessable possibilities is rather large. The adequate strategy to be taken in such cases would be to search for the largest plausibility. One important criterion is thus the past frequency of similar incidents. And we should ask for the means and occasions available. Obviously, if dealing with an explicit air strike, given the fact that in former times, gas had been used in attacks by the Syrian government, the most plausible answer points to Syria. (Note: We would argue, with a certain amount of plausibility that this points to Syria rather than Russia, but on the other hand, what is the plausibility attached then to the possible originator of the nerve agent attack on father and daughter Skripal in Salisbury?)

3. Savage Thinking (Lévi-Strauss)

In order to illuminate somewhat the anthropological foundations of the above-mentioned, primarily of the intrinsic antipathy against complex boundary conditions which seriously restrict the hermeneutic capacity of humans, we will discuss here aspects of what is usually called “savage thinking”. And we take as a first, provisional definition that savage thinking visualized as a kind of untamed human thought can be defined as a type of reflexion that continually gathers and applies structures wherever they can be used. If scientific thought is represented by asking questions and trying to design an adequate, if not optimal or complete, solution, savage thought resembles the work of the bricoleur (the “tinkerer”) who constructs things using whatever is at hand. This concept, dating
back to Claude Lévi-Strauss, is explained by himself in terms of a famous example given in his paper on “The Sorcerer and his Magic” (1949). [In: id.: Structural Anthropology, vol. 1 (1958)]:

After a young man of the Zuni in New Mexico had grasped for the hands of a young woman, she collapsed. The man was accused of applying magic what he first denied. But because the people did not believe him, and the death penalty was immanent, he then admitted the deed and performed a complicated ritual entering a state of trance. Then he said he (and she) would be cured now. But during the night he tried to escape and was re-captured and once-more charged with magic. This time he admitted again, telling a lengthy story, and said his magical power would rest on a set of magical feathers in his possession. The judges asked him to show them. He led them to his house, but could not find any feathers for a long while, apologizing for not having used them recently. Finally he found a very small, old feather behind a wall covering, and he presented it proudly, saying at the same time that now he would have lost his magical power completely. In the following assembly he repeated his story with many more details. And the judges were composed now and discharged him.

Lévi-Strauss comments: „We realize that the accused does not achieve his discharge by exculpating himself, but by admitting his supposed deed – even more: he improves his situation by presenting different versions of the deed, one always more detailed and embellished than the other. The judges do not expect that he contests a thesis nor that he disproves any facts, they instead demand him to confirm a system.“ As Mario Erdheim supplements: „An essential function of magical rituals [of healing] is therefore to assert the community its omnipotence within its centre. […] This omnipotence results in a loss of autonomy for the individual who exchanges for this shelter and a feeling of security. Without such a group contact the individual is hardly viable.“

In other words: The logical foundation of savage thinking is in the confirmation of a given system rather than in the exploration of actual facts. The idea is not to understand the world as it is, but to comply with what the majority of the reference group is believing. Obviously, this is the same when talking about the basic elements of religion, or of esoteric thinking as to that. In a sense, we can visualize this as the social (and political) function of savage thinking. Hence, we could also legitimately speak of “magic” or “mythological” thinking. Modern and more recent examples of this are numerous cases which are discussed from time to time in the relevant public media: such as the story of the Knights Templars, the existence of witches, the story of the Holy Grail (see e.g. Baigent, Leigh, Lincoln, 1982; and notoriously: Dan Brown, 2003, 2006), the equally notorious Protocols of the Sages of Zion (published first in 1903 in Russian, then demonstrated to be a fake in 1921 by The Times), various stories related to what is called ufology (famous for its impact in the radio play by Orson Welles, 1938), or related to an alleged faking of the Moon Landing (invented probably by Kaysing, 1976), or stories about the interaction of mobile phones with cosmic radiation (Ghana, 2008), conspiracy theories related to the events around 9/11, and so on, and so forth. Umberto Eco’s novel “Foucault’s Pendulum” (1989) is a good illustration of all of this (the difference being that the latter is also funny and entertaining).2

Hence, the common aspect is always that there is a [usually syncretistic] world view derived from a closed system of thinking with its own logic that abandons empirically verifiable facts. This closed view within a context of closed collective subjectivity is indeed magical. And it possesses the obvious function to relieve the group from the burden of increased complexity in the ongoing interaction with its environment.

Note on „Political Correctness“

Visualized in the sense of what has been said above, we can realize that the behaviour introduced as “politically correct” is also an example of savage thinking indeed, because “political correctness” implies that there could be an absolute (context-independent) meaning of words associated with one uniquely correct formulation. There is also implicit a striving for conceptual

---

1 We quote and paraphrase here according to the German edition (Suhrkamp, Frankfurt a.M., ²1981, 187 sqq.)

2 Note that shortly before publication of this novel, the secret lodge P2 ( = Propaganda Due) was indeed unveiled that had been active from 1887 through 1944 in Italy, and came to an end not before 1981.
“pureness” pointing to a language hygiene common in right-wing conceptions. Obviously, something like this cannot actually exist at all. On the other hand, it is “political correctness” that aims at an equi-distribution of the value of different opinions and beliefs in order to dispose of any inherent ranking in arguments. However, this is also a conceptual error: There is no reasonable argument that stands against the priority of scientific results and insight derived from them. Democracy guarantees the right to always utter what one thinks, but it does not guarantee that what one thinks is always right. Because facticity is much more than personal opinion. Hence, an essentially good idea in the first place (to look for the correctness of language) has been more and more perverted to an instrument of language hygiene.

A recent example from politics shows how savage thought based on „alternative facts“ can be rejected in time by a political correctness which is understood in its original sense, when president Obama attacks during the 2011 White House correspondents dinner. 4. Reading Capital (Althusser)

In Marxist theory, the discursive aspects discussed here are directly referred to the process of scientific investigation itself. We can see this in Althusser with respect to economics. The starting point for Althusser’s approach is the mis-conception of hermeneutic techniques, if applied within the framework of a given ideological viewpoint that is not quite consistent when compared with the “state of the art”. Hence, explicitly parallel worlds can be encountered according to the chosen perspective of interpretation. I paraphrase here: “What the classical political economy does not see is not really what it does not see, but it is indeed what it sees; it is not what is missing, but on the contrary it is what is not missing, it is not what it falls short of, but on the contrary what it does not fall short of. The error is in not seeing what one actually sees: This error does not refer to the object, it refers to seeing itself. The error is one that concerns seeing itself: the non-seeing is thus something which is in the interior of seeing, this is a form of seeing itself and is hence in a necessary relationship to seeing.”

This hermeneutic approach can be straightforwardly applied to other fields, too. In particular, it is also true for the field of public communication, especially with a view to modern digital media. This figure of not seeing what one actually sees has been discussed in detail within the theories of semiology (semiotics) and psychoanalysis in the French tradition. What we learn from this is essentially that the type of savage (or magic or mythological) thinking mentioned here is part of what in the terminology of existentialism had been called “mauvaise foi” (insincerity or bad faith) before: It is the person’s choice of a conceptual context that serves a hermeneutic interpretation of his or her own situation compatible with what has been imagined as the person’s individual project before. Usually, this results in a considerable reduction of complexity, because, obviously, this chosen context is the more stable, the less complex it is. Hence, the aversion against observable complexity.

5. Totalitarianism (Arendt)

It is interesting to note that in her famous book, Hannah Arendt follows a very similar line of argument when describing the origins of totalitarianism: She differentiates the developmental phases of Antisemitism (Jews are visualized as supporters of the state that cannot be controlled), Imperialism (downfall of colonialism) – including the emergence of “Pan Movements”, Total Governance...

---

3 I quote (and translate) here from the New German edition: Louis Althusser et al., Das Kapital lesen [Reading Capital (1965 sqq.)], ed. F. O. Wolf et al., Westfälisches Dampfboot, Münster, 2015, 31 sq.

(downfall of the national state, end of human rights, downfall of class society), and Mob & Elite that
coop-erate temporarily in order to establish an institutionalized apparatus forming terror as a new
form of state (propaganda is functioning as an instrument to prepare this).

She formulates with a view to this propaganda: „The main difficulty of totalitarian propaganda is
that it cannot fulfil the yearning [nostalgia] of the masses for a consequent, comprehensible, and
predictable development without coming into conflict with common sense. […] It is as if the masses
would demand for a permanent repetition of the Septuaginta’s miracle that reports that seventy
disjoint translators achieved an identical Greek translation of the Old Testament.“ And she continues:
„This possessed blindness which is characteristic for the escape of the masses from actuality into a self-
consistent fictitious world corresponds to their homelessness within a world where they cannot exist
anymore, because the anarchic coincidence in the shape of annihilating catastrophes has become their
master.“ […] [We have here the advent of progress & complexity. The emphasis is mine.] Hence: „The
masses’ revolt against common sense’s intuition of actuality and what appears to be plausible within
the course of the world is the result of an atomization by which it has not only lost its position within
society, but also the whole sphere of communal relationships within whose frame only common sense
can function in a reasonable way. “The key word is “possessed blindness” here. This is practically bad
faith on a global scale (with respect to the relevant social collective). The menace for the people is one
of the immanent evolution of which they are not active agents: History happens to them. So she
continues: „In a situation of complete spiritual and social homelessness, the well-balanced insight
into the mutual conditioning of the arbitrary and the planned, of the coincidental and the necessary,
by which the course of the world constitutes itself, does not make sense anymore. Only where
common sense does not make sense, can totalitarian propaganda slap into its face. […] and this not,
because they are stupid or bad, but because within the general collapse of chaos this escape into
fiction is at least what seems to guarantee them a minimum of self-respect and human dignity.“

Conclusion

Hence, we can conclude that Savage Thought is to be understood as an answer to the increasing
complexity of everyday life. Essentially, in the European countries, this tendency has accumulated
after World War II, while it was initialized a long time before, in Germany probably from the period
immediately after the Austrian and French wars. Accelerating increase of complexity means explicitly
the increase in the quantities and qualities of observable differences (cultural, moral etc.). Hence,
more recently, this concerns mainly: globalisation, industrialization, digitalisation in technical terms,
change in work and life balances (emancipation of women, of the youth etc., change in sexual
behaviour, change of life styles and so forth). The militant refusal of complexity leads to a social
backward-oriented motion which can be identified as a modern version of mythological thinking.
Technically spoken (and sufficiently abstract), the discursive structure is one where the signifier is
identified with the signifyate (in Lacanian notation: S = s). Similar motions have been discussed in
detail at various occasions under different names (alienation/ideology (Marx), non-simultaneousness
(Bloch), bad faith (Sartre) and some others). Altogether what we deal with here is the explicit refusal
of complexity which is thus a moral attitude, and not an ethical one.
