Abstract: Secondary transportation of raw and comminuted forest products is a major component in forest harvesting operations in terms of economics, public perception, and safety. Consequently, there is a substantial amount of literature on this topic. The existing literature has dealt with many of the technical aspects of transportation with a majority of them focusing on improving supply chain issues; However, there are only few specific to secondary transportation issues in general. This annotated bibliography will help practitioners, researchers, and stakeholders gain a better understanding of the existing literature from 2000 to 2015. To this end, we began by classifying the selected literature into six themes: cost, roads and routes, trucking, efficiency & safety, other modes of transportation, and supply chain & optimization. Woody biomass for bioenergy production was the most researched forest product with respect to transportation. About one-third of the articles were presented in the context of supply chain modeling and optimization. More than half of the studies originated from Europe while the United States had the most publications for any given country. The most articles (16) were published in 2013. *Biomass and Bioenergy* published the highest number of articles (29) during the timeframe.

Keywords: forest biomass; timber harvest residue; supply chain; trucking; delivery; logging residue

Transportation in forest operations can be broadly divided into two phases. The first phase involves moving wood from the stump to the roadside/landing sites, referred to as primary transportation. The second phase involves the hauling of the processed forest products (sawlog, pulpwood, or energy wood biomass) from the roadside/landing sites to the processing facilities, referred to as secondary transportation [1]. Secondary transportation is considered to be one of the most expensive elements in the harvesting operation, generally accounting for 30–50% of the total cost, depending on the distance travelled and compared to the cost of the primary transportation [2–4]. Therefore, improvements in secondary transportation may yield significant overall cost reductions.

Secondary transportation is predominantly road-based. Various factors influence the cost of secondary transportation including - but not limited to - the road network (road types) and conditions (infrastructure), cost of operating the truck, weight limitations, and hauling distance. Research generally focuses on the transportation problem addressing one or some of these factors, but rarely all at the same time. It cannot be expected that one research activity can look into all of these factors because addressing each topic requires expertise in different domains. Nonetheless, having all informational aspects on transportation integrated will be of great value to stakeholders.

The purpose of this study is to address this gap, by proposing a classification of a collection of scientific literature and addressing several relevant topics in forest products secondary transportation. It provides an overview of the current state of the art, and helps in identifying knowledge gaps that require further attention. To this end, the objective of this article is to list the major findings from these studies and assess the chronological development of forest products secondary transportation research in the past 15 years.

### 2. Materials and Methods

### 90 2.1. Literature Review

The literature was searched using major online databases and library catalogs: CrossRef, Scopus, Google Scholar, and Web of Science. The initial search started in November 2016 with three

keywords: "forest transportation", "forest trucking", and "wood supply chain", which yielded 71 scientific articles. After careful analysis of those articles, four more keywords, "forest optimization", "biomass', "sawlogs" and "forest roads" were used to gather more literatures. Additionally, the reference section of the previously selected articles was also utilized for more specific search. A total of 169 scientific articles (related to forest products secondary transportation) were identified as relevant to this process. The four major journals with the highest publication frequency of related articles were selected and every issue of those journals from year 2000 to 2015 was searched again (Table 1). These journals were accessed through the University of Maine library resources from January to April 2016. A total of 369 volumes and issues of these four journals were assessed in order to include all information in these four journals related to forest products transportation. A total of 131 articles were chosen as relevant for the purpose of this review. The article search was limited to English-written scientific articles.

## 109 2.2. Literature Categorization and Classification

Based on the scope and objectives of articles identified, six major research themes emerged:

- I. Cost of transportation
- II. Roads and route planning
- III. Trucking characteristics
- 114 IV. Efficiency and safety
- V. Other modes of transportation
- VI. Supply chain and optimization.

The classification is intended to facilitate compilation and reporting. Understandably, some of the themes overlapped. For example, there were several software and models which generated results that could be included in Theme II- Roads and route planning and VI - Supply chain and optimizations. Several articles dealt with more than one theme. Additionally, for minimizing ambiguity, no articles in one theme have been repeated in another.

Theme I (Cost) primarily dealt with articles focusing on financial aspects of trucking operations. The theme also included articles related to detailed time studies; strategies to minimize the overall transportation costs; assessing the impacts of transportation distance on final cost of delivered forest products; and evaluating the performance of transportation cost estimating software and models. Theme II (Roads and route planning), focused on every aspect of forest roads including engineering, planning, design, construction, maintenance, spatial modeling, and computer software. Theme III (Trucking characteristics) was specific to road transportation: truck size and configuration, speed at various road conditions, weight limits, payload enhancement measures, trucking performance, and features of trailers. Theme IV (Efficiency and safety) dealt with fuel efficiency, log truck accident analysis, social surveys with related stakeholders, evaluation of fuel consumption capacity, and potential effects of forest road erosion on the supply chain. Theme V (Other modes of transportation) focused on articles dealing with railways and water transportation. Theme VI (Supply chain and optimizations) included modelling supply chain in different regions, geospatial evaluations, linear programming, strategic and tactical planning, optimization of supply chain, decision support tools for wood procurement and management, and simulation of logistics models.

Each article was evaluated for country of study, objectives researched and major findings, resulting in Table 2.

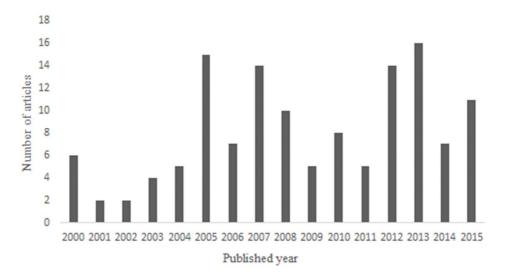

**Table 2.** Distribution of articles related to forest products secondary transportation based on the geographic location of the study.

| Region                  | Number of articles |
|-------------------------|--------------------|
| Europe                  | 73                 |
| North America           | 43                 |
| Asia                    | 8                  |
| Australia & New Zealand | 3                  |
| Africa                  | 2                  |
| South America           | 2                  |

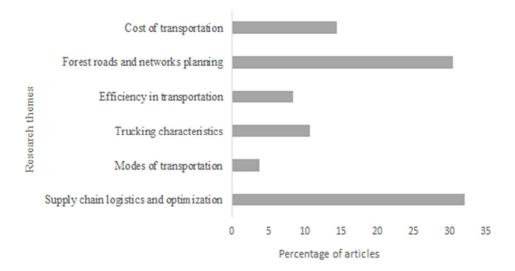

#### 3. Results

Out of the 131 articles reviewed, 127 were published in peer-reviewed scientific journals, three in conference proceedings and one was a cooperative extension article. With more than 22% publications, Biomass and Bioenergy published the highest number of articles related to the field followed by Croatian Journal of Forest Engineering (Table 1). On a regional basis, about 56% of the research articles were published by authors based in Europe followed by 33% from North America (Table 2). However, the United States had the highest number of publications on a per country basis. Several articles were authored by authors from multiple countries.

For the given period, the highest number of articles was published in 2013 (16 articles) followed by 2005 (15) (Figure 1). Hence the interest seems to be growing. On average, eight articles related to forest products transportation and supply chain were published per year from 2000 to 2015. Nearly 33% of the reviews were related to supply chain logistics and optimization (Figure 2).

**Figure 1.** Distribution of articles related to forest products secondary transportation over the years of publication (2000 to 2015).

**Figure 2.** Distribution of articles in forest products secondary transportation based on research themes.

#### 3.1. Theme I - Cost

There were 19 articles in this category, accounting for approximately 15% of the total articles reviewed. An average of a little more than one article per year was published in this category. A majority of the articles (more than 80%) were based on comminuted forest products, mainly wood chips, logging and industrial residues for bioenergy and biofuel production (Table 3). The greatest number of publications (6 articles) were based in the USA, followed by Sweden, Finland and Austria.

Sawmill residue (5), and wood pellets (6)

## 175 3.2. Theme II – Roads and route planning

176

177

178

179

180

181

182

A total of 40 articles (about 31%) were categorized under this theme, averaging 2.5 articles published per year. Similar to the Theme I, the greatest number of publications were from the United States (12 articles) followed by Turkey, Croatia, Slovenia, Sweden, Iran, and Japan (Table 4). Articles related to GIS modeling and linear & mixed integer programming to solve forest road planning problems were included in this theme instead of Theme VI (Supply chain and optimization). Similarly, for articles analyzing costs related to certain aspects of forest roads (i.e. construction) were included in Theme II instead of Theme I (cost).

| Beck et al. [29]  | USA       | Developing a novel algorithm using     | Comparing geometric variables from aerial and terrestrial          |
|                   |           | Aerial LiDAR for forest road           | LiDAR datasets showed that the average difference in road          |
|                   |           | extraction                             | width was 1.1 m while the slope differences of cut/fill was        |
|                   |           |  | minimum of 4%. In addition, the difference in slope across road    |
|                   |           |  | was only 2%.   |
| Boston et al.     | USA       | Discussed the potential economic       | Results from the study showed that a 34% saving in road            |
| [30]              |           | gain in construction of surface layer  | aggregates cost was possible with improvement in road              |
|                   |           | of roads by improving subgrade         | subgrades.   |
| Contreras et al.  | USA       | Compared ant colony optimization       | The solutions obtained from ACO were equal to or inferior to       |
| [31]              |           | (ACO) meta-heuristic and mixed-        | the MIP solution. However, ACO algorithm took less                 |
|                   |           | integer programming (MIP) to solve     | computational time than latter.                                    |
|                   |           | forest transportation planning         |  |
|                   |           | problems                               |  |
| Contreras et al.  | USA       | Developing a model to enhance          | As the spacing of cross-section increased, the capability of the   |
| [32]              |           | earthwork volume estimation for        | model to capture differences in terrain decreased. Thus, the       |
|                   |           | forest roads using digital elevation   | correctness of earthwork volume estimation was low. As a           |
|                   |           | model with high resolutions.           | result, short cross-section spacing was favorable to improve       |
|                   |           |  | accuracy in earthwork volume estimation in case of hilly and       |
|                   |           |  | rugged terrain.  |

| Demir [33]                      | Turkey   | Analyzed forest road network system   | There was a need of ~201,000 km forest roads in Turkey. The anticipated time to complete those planned road networks was  |
|---------------------------------|----------|---|---|
|                                 |          |   | about 20 years.   |
| Devlin et al.<br>[34]           | Ireland  | Comparing the existing timber transportation routes from a central depot to other destinations with GIS generated simulated routes.                   | The findings showed that the real GPS routes were not as same as shortest route generated by Network Analyst Tool (NAT).  Nevertheless, after manipulation of NAT the similarity increased to more than 90%.  |
| Ghaffarian and<br>Sobhani [35]  | Iran     | Determining the best-fit forest road network that could minimize the total cost of road maintenance.  | The data analysis in Network 2000 based on pre-existing forest road network showed that the best solution can be achieved in the cost of $27.19  \text{e/m}^3$ .  |
| Ghajar et al.<br>[36]           | Iran     | Demonstration of a procedure that incorporated rock proportion for embankment construction in forest roads.   | This approach was useful to show the variability of rock proportion and model excavation costs.   |
| Greulich [37]<br>(review paper) | USA      | Analyzed the evolution of transportation network in forest harvesting   | Theoretical basis for transportation networks in forest harvesting was mainly developed by early European academics. From twentieth century, this theory sustained its development in America. In the last fifty years, there has been swift development in Europe and America, with Asia also putting significant contributions. |
| Gumus [38]                      | Turkey   | Assessed the future use of forest road networks for sustainable forestry  | The findings showed that most of the roads in the study area was in the standard to fulfill sustainable forestry target.  However, the 20% of the roads were in worse condition.  |
| Gumus et al.<br>[39]            | Turkey   | Developing a new road network planning procedure and comparing it to pre-existing networks for environmental impact assessment (EIA)                  | More than 90% of the planned roads were in minimum negative impact zone while only about 10% of the planned roads were in maximum risk zone. The purposed criteria for future road development was 20 m/ha.   |
| Hernández-<br>Díaz et al. [40]  | Mexico   | Assessing the impacts of forest roads on soil in a timber harvesting area   | The level of ground along the truck ruts was decreased to about 38-58 mm in rainy season by run-off. Removal of some tertiary roads were proposed for road density reduction. The expected soil loss reduction could be 20% with this proposed plan.  |
| Košir and Krč<br>[41]           | Slovenia | Presented the existing condition of forest road design and construction in Slovenia and adopt multi-criteria decision model to build new forest roads | Results showed that the terrain was suitable for the planning and execution of forest roads construction. The model proposed could be considered for future forest road construction in Slovenia.   |
| Krč and Beguš<br>[42]           | Slovenia | Developed a model that can identify inaccessible forests and helped in future forest roads planning.  | There was still 210,385 ha of inaccessible forests. The construction of 758 km of new roads was planned at the national level to access some parts of the inaccessible forests.  The researcher believed that the model could be used for different scenarios and for other regions in the world.                                 |

| Lugo and<br>Gucinski [43] | USA      | Analyzed the function and effects of forest roads on forested rural landscape. | The study suggested that a road ecosystem approach that incorporates environmental gradient analysis should be used for planning and design of forest roads. |
|---------------------------|----------|--|--|
| Murphy and                | USA      | Developed a two-stage robust   | The results showed that the deterministic solution was unstable  |
| Stander                   |          | optimization model to deal with the  | and dependent on some degree of uncertainty, that the robust   |
| [44]                      |          | actual transportation problems in  | solution was dependent on the variables used.  |
| []                        |          | forestry.  |  |
| Najafi and                | Iran and | Developed a model using mixed  | The model was able to reduce overall costs of road construction  |
| Richards [45]             | Canada   | integer programming to design a  | and maintenance. High quality solutions were obtained in   |
|                           |          | forest road system including logging   | considerably less time.  |
|                           |          | roads for trucking and access spurs  | ·  |

187 3.3. Theme III – Trucking characteristics

This section comprised of 14 articles which was about 11% of the total (Table 5). About 60% of the studies were related to the transportation of sawlogs and pulpwood. A total of five studies were

190 191 192 carried out in the USA followed by four in Finland. Apart from trucking features, Theme III also included topics such as GPS tracking system, options for backhauling empty trucks, and solution for truck scheduling problems in forest operations.

## 212 3.6. Theme VI – Supply chain and optimization

213

214

215

216

217

218

219

The supply chain logistics and optimization was the most studied topic related to forest products transportation in the given timeline. There were 42 articles in this category with an average frequency of 2.6 articles per year (Table 8). More than 70% of the studies were based on biomass, energy woods and logging residues. Highest number of studies were carried out in Canada and US with eight articles each, followed by Sweden (6 articles), Finland, and Greece (5 articles each).

**Table 8.** Published scientific articles handling various aspects related to forest products supply chains. The recommendation/ findings are specific to the research/ region and conditions described in the article.

| Authors     | Countries | Wood       | Objectives                       | Major finding(s) and/or suggestions                    |

#### 4. Discussion

The collection and classification of scientific literature on secondary forest products transportation found that more than half of the studies addressed the transportation of woody biomass from forest, and industrial residues for bioenergy generation. Generally, woody biomass generated from forest operations and forest products industries are regarded as low value products compared to the primary forest products such as sawlogs and pulpwood. This raises a question as to why the frequency of the scientific studies was higher for transportation of low-value biomass. Woody biomass constitutes forest residues with low bulk density that are not economically feasible to transport in the raw form. In regions without a demand for biomass, forest residues are generally left at the harvesting site [5].

Much of the reasoning for this comes from the funding sources for research. Empirical evidence tells us that most research funding comes from government agencies, as opposed to direct industry input, and government policies lately have been focused more upon biomass than high values forest products. Much of this is driven by interests in atmospheric carbon issues and in reduction of hazardous forest fire fuels

On a regional basis, higher number of studies were published from Europe followed by North America and Asia. This high number of articles from Europe can be attributed to the policies favoring biomass utilization. While transportation cost is considered to be one of the major limiting factors for biomass utilization, the feasibility also depends heavily on favorable policies. Country wise, USA had the highest number of publications which could be due to large area of managed timberland, and a developed economy which sustains on high level of research.

Biomass and Bioenergy journal published highest number of articles on the subject. This is related to the higher number of studies focusing on the transportation of forest residues. Forest products transportation is an important component of forest engineering, thus there were significant number of articles in journals like Croatian Journal of Forest Engineering and International Journal of Forest Engineering.

Two of the most studied research topics on forest products transportation were supply chain models and forest roads. Many site and region-specific optimization and supply chain models have been tested and presented, which increased the number of publications. Similarly, forest roads are crucial for hauling wood materials from harvesting sites to the markets. Construction and maintenance of roads requires huge amount of investment. In this study, there were only 14 articles

- 254 directly related to trucking characteristics, however, most of the other articles (dealt in the study) also 255 discussed trucking in many different ways.
- 256 Overall, the results indicated a need for more research on increasing the efficiency of 257 transportation systems, specifically trucking. Except for one study done in Finland, there was no 258 research focusing on the overall challenges facing the forest trucking industry as a whole [6]. The cost 259 of transportation is also another major topic that needs to be addressed in the future.

#### 5. Conclusions

260

- 261 Regardless of categorization into different research themes, the main aim of all the collected 262 articles in this study was to address the challenges faced by the secondary transportation of forest 263 products. Major details on each article including research location, forest products dealt, primary 264 objectives and key findings related to transportation were presented in tabular format. This review 265 is expected to help researchers' for summarizing prior studies on forest transportation. It will also 266 provide insight on the specifics that are lacking in this sector and show the way ahead for future 267 research and innovation. This article is based on literature collection and assortment and thus should 268 not be regarded as critical literature synthesis article.
- 269 Author Contributions: Conceptualization of this article was done by A.K and A.R.K.; methodology, data 270 analysis, and manuscript preparation for this article was primarily done by AK; All authors contributed to 271 editing and partially to data collection; Project Administration and funding acquisition for the study was done 272 by A.R.K.
- 273 Funding: This project was supported by the USDA National Institute of Food and Agriculture, McIntire-Stennis 274 project number #ME0-41621 through the Maine Agricultural & Forest Experiment Station.
- 275 Conflicts of Interest: The authors declare no conflict of interest. The funders had no role in the design of the 276 study; in the collection, analyses, or interpretation of data; in the writing of the manuscript, and in the decision 277 to publish the results.
