(Dated: January 23, 2019)

J. C. Maxwell, B. Riemann and H. Poincaré have proposed the idea that all microscopic particles are sink flows in a fluidic aether. Following this research program, a previous theory of gravitation based on a mechanical model of vacuum and a sink flow model of particles is generalized by methods of special relativistic continuum mechanics. In inertial coordinate systems, we construct a tensorial potential which satisfies the wave equation. Inspired by the equation of motion of a test particle, a definition of a metric tensor of a Riemannian spacetime is introduced. Applying Fock’s theorem, a generalized Einstein’s equation in inertial systems is derived based on some assumptions. This equation reduces to Einstein’s equation in case of weak field in harmonic coordinate systems. In some special non-inertial coordinate systems, a second generalized Einstein’s equation is derived based on some assumptions. If the field is weak and the coordinate system is quasi-inertial and harmonic, the second generalized Einstein’s equation reduces to Einstein’s equation. Thus, this theory may also explains all the experiments which support the theory of general relativity. There exists some fundamental differences between this theory and Einstein’s theory of general relativity.

Keywords: Einstein’s equation; gravitation; general relativity; sink; gravitational aether.
I. INTRODUCTION

The Einstein’s equation of gravitational fields in the theory of general relativity can be written as [1, 2]

\[ R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R = -\kappa T_{\mu\nu}^m, \]  (1)

where \( g_{\mu\nu} \) is the metric tensor of a Riemannian spacetime, \( R_{\mu\nu} \) is the Ricci tensor, \( R \equiv g^{\mu\nu}R_{\mu\nu} \) is the scalar curvature, \( g^{\mu\nu} \) is the contravariant metric tensor, \( \kappa = 8\pi\gamma_N/c^4 \), \( \gamma_N \) is Newton’s gravitational constant, \( c \) is the speed of light in vacuum, \( T_{\mu\nu}^m \) is the energy-momentum tensor of a matter system.

The Einstein’s equation (1) is a fundamental assumption in the theory of general relativity [1, 2]. It is remarkable that Einstein’s theory of general relativity, born 102 years ago, has held up under every experimental test, refers to, for instance, [3].

There is a long history of researches of derivations or interpretations of Einstein’s theory of general relativity. For instance, C. Misner et al. introduce six derivations of the Einstein’s equation Eq.(1) in their great book ([2], p117). S. Weinberg proposed two derivations ([1], p151).

However, these theories still face the following difficulties. (1) Attempts to reconcile the theory of general relativity and quantum mechanics have met some mathematical difficulties ([4], p101); (2) The cosmological constant problem is still a puzzle, refers to, for instance, [5]; (3) The existence of black hole is still controversy, refers to, for instance, [6]; (4) Theoretical interpretation of P. A. M. Dirac’s dimensionless large number ([7], p73) is still open; (5) The existences and characters of dark matter and dark energy are still controversy, refers to, for instance, [8]; (6) The existence and characters of gravitational aether are still not clear, refers to, for instance, [9]; (7) Whether Newton’s gravitational constant \( \gamma_N \) depends on time and space is still not clear [10]; (8) Whether the speed of light in vacuum depends on time or space is controversy, refers to, for instance, [11].

Furthermore, there exists some other problems related to the theories of gravity, for instance, the definition of inertial system, origin of inertial force, the velocity of the propagation of gravity [12], the velocity of individual photons [13, 14], unified field theory, etc.

The purpose of this manuscript is to propose a derivation of the Einstein’s equation (1) in inertial coordinate systems based on a mechanical model of vacuum and a sink flow model of particles [15].

II. INTRODUCTION OF A PREVIOUS THEORY OF GRAVITATION BASED ON A SINK FLOW MODEL OF PARTICLES BY METHODS OF CLASSICAL FLUID MECHANICS

The idea that all microscopic particles are sink flows in a fluidic substratum is not new. For instance, in order to compare fluid motions with electric fields, J. C. Maxwell introduced an analogy between source or sink flows and electric charges ([16], p243). B. Riemann speculates that: “I make the hypothesis that space is filled with a substance which continually flows into ponderable atoms, and vanishes there from the world of phenomena, the corporeal electric charges ([16], p243). B. Riemann speculates that: ”

We briefly introduce this theory of gravitation [15]. Suppose that there exists a fluidic medium filling the inter-planetary vacuum. For convenience, we may call this medium as the \( \Omega(0) \) substratum, or gravitational aether, or tao [15]. Suppose that the following conditions are valid: (1) the \( \Omega(0) \) substratum is an ideal fluid; (2) the ideal fluid is irrotational and barotropic; (3) the density of the \( \Omega(0) \) substratum is homogeneous; (4) there are no external body forces exerted on the fluid; (5) the fluid is unbounded and the velocity of the fluid at the infinity is approaching to zero.

An illustration of the velocity field of a sink flow can be found in Figure 1. If a point source is moving with a velocity \( v_s \), then there is a force [15]

\[ F_Q = -\rho_0 Q(u - v_s) \]  (2)

is exerted on the source by the fluid, where \( \rho_0 \) is the density of the fluid, \( Q \) is the strength of the source, \( u \) is the velocity of the fluid at the location of the source induced by all means other than the source itself.

We suppose that all the elementary sinks were created simultaneously [15]. For convenience, we may call these elementary sinks as monads. The initial masses and the strengths of the monads are the same. Suppose that (1)
\( \mathbf{v}_i \ll \mathbf{u}_i, \ i = 1, 2, \) where \( \mathbf{v}_i \) is the velocity of the particle with mass \( m_i \), \( \mathbf{u}_i \) is the velocity of the \( \Omega(0) \) substratum at the location of the particle with mass \( m_i \) induced by the other particle; (2) there are no other forces exerted on the particles, then the force \( \mathbf{F}_{21}(t) \) exerted on the particle with mass \( m_2(t) \) by the velocity field of \( \Omega(0) \) substratum induced by the particle with mass \( m_1(t) \) is [15]

\[
\mathbf{F}_{21}(t) = -\gamma_N(t) \frac{m_1(t)m_2(t)}{r^2} \hat{r}_{21},
\]

where \( \hat{r}_{21} \) denotes the unit vector directed outward along the line from the particle with mass \( m_1(t) \) to the particle with mass \( m_2(t) \), \( r \) is the distance between the two particles, \( m_0(t) \) is the mass of monad at time \( t \), \( -q_0(q_0 > 0) \) is the strength of a monad, and

\[
\gamma_N(t) = \frac{\rho_0 q_0^2}{4\pi m_0^2(t)}.
\]

For continuously distributed matter, we have

\[
\frac{\partial \rho_0}{\partial t} + \nabla \cdot (\rho_0 \mathbf{u}) = -\rho_0 \rho_s,
\]

where \( \mathbf{u} \) is the velocity of the \( \Omega(0) \) substratum, \( \nabla = i\partial/\partial x + j\partial/\partial y + k\partial/\partial z \) is the nabla operator introduced by Hamilton, \( i, j, k \) are basis vectors, \( -\rho_s(\rho_s > 0) \) is the density of continuously distributed sinks, i.e.,

\[
-\rho_s = \lim_{\Delta V \to 0} \frac{\Delta Q}{\Delta V},
\]

where \( \Delta Q \) is the source strength of the continuously distributed matter in the volume \( \Delta V \) of the \( \Omega(0) \) substratum.

Since the \( \Omega(0) \) substratum is homogeneous, i.e., \( \partial \rho_0/\partial t = \partial \rho_0/\partial x = \partial \rho_0/\partial y = \partial \rho_0/\partial z = 0 \), and irrotational, i.e., \( \nabla \times \mathbf{u} = 0 \), Eq.(5) can be written as [20]

\[
\nabla^2 \varphi = -\rho_s,
\]

where \( \varphi \) is a velocity potential such that \( \mathbf{u} = \nabla \varphi \), \( \nabla^2 = \partial^2/\partial x^2 + \partial^2/\partial y^2 + \partial^2/\partial z^2 \) is the Laplace operator.

We introduce the following definitions

\[
\Phi = \frac{\rho_0 q_0}{m_0} \varphi, \quad \rho_m = \frac{m_0 \rho_s}{q_0},
\]

where \( \rho_m \) denotes the mass density of continuously distributed particles.

Using Eq.(8) and Eq.(4), Eq.(7) can be written as

\[
\nabla^2 \Phi = -4\pi \gamma_N \rho_m.
\]

### III. A MECHANICAL MODEL OF VACUUM

According to our previous paper [21] we suppose that vacuum is filled with a kind of continuously distributed material which may be called \( \Omega(1) \) substratum or electromagnetic aether. Maxwell’s equations in vacuum are derived
by methods of continuum mechanics based on this mechanical model of vacuum and a source and sink flow model of electric charges [21]. We speculate that the electromagnetic aether may also generate gravity. Thus, we introduce the following assumption.

**Assumption 1** The particles that constitute the \( \Omega(1) \) substratum, or the electromagnetic aether, are sinks in the \( \Omega(0) \) substratum.

Then, according to the previous theory of gravitation [15], these \( \Omega(1) \) particles gravitate with each other and also attract with matters. Thus, vacuum is composed of at least two kinds of interacting substratums, i.e., the gravitational aether \( \Omega(0) \) and the electromagnetic aether \( \Omega(1) \).

From Eq.(2), we see that there exists a following universal damping force \( \mathbf{F}_d = -\rho_0 q_0 m \mathbf{v}_p / m_0 \) exerted on each particle by the \( \Omega(0) \) substratum [15], where \( \mathbf{v}_p \) is the velocity of the particle. Based on this universal damping force \( \mathbf{F}_d \) and some assumptions, we derive a generalized Schrödinger equation for microscopic particles [22]. For convenience, we may call these theories [15, 21, 22] as the theory of vacuum mechanics.

**IV. CONSTRUCTION OF A LAGRANGIAN FOR FREE FIELDS OF THE \( \Omega(0) \) SUBSTRATUM BASED ON A TENSORIAL POTENTIAL IN THE GALILEAN COORDINATES**

There exists some approaches ([23], page vii;[2], p424), which regards Einstein’s general relativity as a special relativistic field theory in an unobservable flat spacetime, to derive the Einstein’s equation (1). However, these theories cannot provide a physical definition of the tensorial potential of gravitational fields, refers to, for instance, [2, 24, 25]. Thus, similar to the theory of general relativity, these theories may be regarded as phenomenological theories of gravitation.

Inspired by these special relativistic field theories of gravitation, we explore the possibility of establishing a similar theory based on the theory of vacuum mechanics [15, 21, 22]. Thus, first of all, we need to construct a Lagrangian for free fields of the \( \Omega(0) \) substratum based on a tensorial potential in the Galilean coordinates. In this section, we will regard the \( \Omega(0) \) substratum in the previous theory of gravitation [15] as a special relativistic fluid. Then, we will study the \( \Omega(0) \) substratum by methods of special relativistic continuum mechanics [26].

In this article, we adopt the mathematical framework of the theory of special relativity [1]. However, the physical interpretation of the mathematics of the theory of special relativity may be different from Einstein’s theory. It is known that Maxwell’s equations are valid in the frames of reference that attached to the \( \Omega(1) \) substratum [21]. We introduce a Cartesian coordinate system \( \{o, x, y, z\} \) for a three-dimensional Euclidean space that attached to the \( \Omega(1) \) substratum. Let \{0, t\} be a one-dimensional time coordinate. We denote this reference frame as \( S_{\Omega(1)} \).

Based on the Maxwell’s equations, the law of propagation of an electromagnetic wave front in this reference frame \( S_{\Omega(1)} \) can be derived and can be written as ([27],p13)

\[
\frac{1}{c^2} \left( \frac{\partial \omega}{\partial t} \right)^2 - \left( \frac{\partial \omega}{\partial x} \right)^2 - \left( \frac{\partial \omega}{\partial y} \right)^2 - \left( \frac{\partial \omega}{\partial z} \right)^2 = 0, \tag{10}
\]

where \( \omega(t, x, y, z) \) is an electromagnetic wave front, \( c \) is the velocity of light in the reference frame \( S_{\Omega(1)} \).

An electromagnetic wave front is a characteristics. According to Fock’s theorem of characteristics ([27], p432), we obtain the following metric tensor \( \eta_{\alpha\beta} = \text{diag}[c^2, -1, -1, -1] \) of a Minkowski spacetime for vacuum ([28], p57).

For convenience, we introduce the following Galilean coordinate system

\[
x^0 \equiv ct, \quad x^1 \equiv x, \quad x^2 \equiv y, \quad x^3 \equiv z. \tag{11}
\]

We will use Greek indices \( \alpha, \beta, \mu, \nu, \) etc., denote the range \( \{0, 1, 2, 3\} \) and use Latin indices \( i, j, k, \) etc., denote the range \( \{1, 2, 3\} \). We will use Einstein’s summation convention, that is, any repeated Greek superscript or subscript appearing in a term of an equation is to be summed from 0 to 3. We introduce the following definition of spacetime interval

\[
ds^2 = \eta_{\mu\nu} dx^\mu dx^\nu, \tag{12}
\]

where \( \eta_{\mu\nu} \) is the metric tensor of the Minkowski spacetime defined by \( \eta_{\mu\nu} = \text{diag}[1, -1, -1, -1] \).

Suppose that the \( \Omega(0) \) substratum is an incompressible viscous fluid. Then, there is no elastic deformations in the fluid and the internal stress states depend on the instantaneous velocity field. Thus, we can choose the reference frame \( S_{\Omega(1)} \) as the co-moving coordinate system. The internal energy \( U \) is the sum of the internal elastic energy \( U_e \)
and the dissipative energy $\dot{U}_d$, i.e., $U = U_c + U_d$. Since there is no elastic deformations in the fluid, we have $U_c = 0$. We introduce the following definition of deviatoric tensor of strain rate $\dot{\gamma}_j^i$ ([29], p332)

$$\dot{\gamma}_j^i = \dot{S}_j^i - \dot{S}_k^i \delta_j^k,$$

(13)

where $\dot{S}_j^i$ is the tensor of strain rate, $\dot{S}_k^i$ is the rate of volume change, $\delta_j^i$ is the Kronecker delta.

Suppose that the rate of dissipative energy $\dot{U}_d$ is the Rayleigh type, then, we have ([29], p332)

$$\dot{U}_d = \mu_0 \dot{\gamma}_j^i \dot{\gamma}_j^i,$$

(14)

where $\mu_0$ is the coefficient of viscosity.

Since the $\Omega(0)$ substratum is incompressible, we have $\dot{S}_k^i = 0$. Thus, from Eq.(14) and Eq.(13), we have

$$\dot{U}_d = \mu_0 \dot{\gamma}_j^i \dot{\gamma}_j^i.$$

(15)

In the low velocity limit, i.e., $u/c \ll 1$, where $u = |u|$, the Lagrangian $L_{w0}$ for free fields of the $\Omega(0)$ substratum can be written as ([29], p332)

$$L_{w0} = \frac{1}{2} \rho_0 u^2 + \int_{t_0}^t \dot{U}_d(\dot{S}_j^i) dt,$$

(16)

where $u = |u|$, $t_0$ is an initial time.

Suppose that the $\Omega(0)$ substratum is a Newtonian fluid and the stress tensor $\sigma_j^i$ is symmetric, then we have ([30], p46)

$$\sigma_j^i = -p \delta_j^i + 2\mu_0 \dot{S}_j^i,$$

(17)

where $p$ is the pressure of the $\Omega(0)$ substratum.

Using Eq.(17) and Eq.(15), Eq.(16) can be written as

$$L_{w0} = \frac{1}{2} \rho_0 u^2 + \int_{t_0}^t (\sigma_j^i + p \delta_j^i) \frac{\dot{S}_j^i}{2} dt,$$

(18)

For a macroscopic observer, the relaxation time $\tau$ of the $\Omega(0)$ substratum is so small that the tensor of strain rate $\dot{S}_j^i$ may be regarded as a slow varying function of time, i.e., $\partial \dot{S}_j^i / \partial t \ll 1$. Thus, in a small time interval $[t_0, t]$, we have $\dot{S}_j^i \geq 0$, or, $\dot{S}_j^i \leq 0$. Then, it is possible to choose a value $\overline{\dot{S}}_j^i + \overline{p} \delta_j^i$ of $\sigma_j^i + p \delta_j^i$ in the time interval $[t_0, t]$ such that Eq.(18) can be written as

$$L_{w0} = \frac{1}{2} \rho_0 u^2 + (\overline{\sigma}_j^i + \overline{p} \delta_j^i) \int_{t_0}^t \frac{\dot{S}_j^i}{2} dt.$$

(19)

We introduce the following definition

$$\psi_{ij} = \frac{1}{2} \int_{t_0}^t \frac{\dot{S}_j^k}{2} dt,$$

(20)

where $f_0$ is a parameter to be determined.

Using Eq.(20), Eq.(19) can be written as

$$L_{w0} = \frac{1}{2} \rho_0 u^2 + f_0 \psi_{ij}(\overline{\sigma}_j^i + \overline{p} \delta_j^i).$$

(21)

Since the coefficient of viscosity $\mu_0$ of the $\Omega(0)$ substratum may be very small, we introduce the following assumption.

**Assumption 2** In the low velocity limit, i.e., $u/c \ll 1$, where $u = |u|$, $u$ is the velocity of the $\Omega(0)$ substratum, we suppose that $\mu_0 \approx 0$ and we have the following conditions

$$\psi_{ij} \approx 0, \quad \partial_{\nu} \psi_{ij} \approx 0, \quad \partial_{\nu} \partial_{\nu} \psi_{ij} \approx 0,$$

(22)

where

$$\partial_{\nu} = \left( \frac{\partial}{\partial x^0}, \frac{\partial}{\partial x^1}, \frac{\partial}{\partial x^2}, \frac{\partial}{\partial x^3} \right).$$

(23)
According to the Stokes-Helmholtz resolution theorem, refers to, for instance, [31], every sufficiently smooth vector field can be decomposed into irrotational and solenoidal parts. Thus, there exists a scalar function \( \varphi \) and a vector function \( \mathbf{R} \) such that the velocity field \( \mathbf{u} \) of the \( \Omega(0) \) substratum can be represented by [31]

\[
\mathbf{u} = \nabla \varphi + \nabla \times \mathbf{R},
\]

where \( \nabla \times \varphi = 0, \nabla \cdot \mathbf{R} = 0 \).

We introduce the following definition of a vector function \( \mathbf{\xi} \)

\[
\frac{\partial \mathbf{\xi}}{\partial (ct)} = \nabla \times \mathbf{R}.
\]

Putting Eq.(25) into Eq.(24), we have

\[
\mathbf{u} = \nabla \varphi + \frac{\partial \mathbf{\xi}}{\partial (ct)}.
\]

Based on Assumption 2 and using Eq.(8) and Eq.(26), Eq.(21) can be written as

\[
L_{w0} = \frac{m_0^2}{2\rho_0 g_0^2} (\nabla \Phi)^2 + \frac{m_0}{q_0} \nabla \Phi \cdot \frac{\partial \mathbf{\xi}}{\partial (ct)} + \frac{\rho_0}{2} \left( \frac{\partial \mathbf{\xi}}{\partial (ct)} \right)^2.
\]

We introduce the following definitions

\[
\psi_{\alpha 0} = -a_{00} \Phi, \quad \psi_{0i} = a_{0i} \xi_i, \quad \psi_{\alpha i} = a_{0i} \xi_\alpha + \psi_{02} j + \psi_{03} k,
\]

where \( a_{00} > 0 \) and \( a_{0i} > 0 \) are 4 parameters to be determined, \( i = 1, 2, 3 \).

Eq.(28) and Eq.(20) have defined a rank 2 symmetric tensor \( \psi_{\mu \nu} \). We require that for some special values of \( a_{00} \) and \( a_{0i} \), Eq.(27) can be written as

\[
L_{w0} = \left( \nabla \psi_{\alpha 0} - \frac{\partial \psi_{\alpha 0}}{\partial (ct)} \right)^2.\quad (30)
\]

Comparing Eq.(30) and Eq.(27) and using Eqs.(28-29), we have

\[
a_{00} = \sqrt{\frac{m_0^2}{2\rho_0 g_0^2}}, \quad a_{0i} = \sqrt{\frac{\rho_0}{2}}. \quad (31)
\]

In order to construct the Lagrangian \( L_0 \) described in Eq.(30) based on the tensorial potential \( \psi_{\mu \nu} \), we should consider all the possible products of derivatives of the tensor \( \psi_{\mu \nu} \). If we require that the two tensor indices of \( \psi_{\mu \nu} \) are different from each other and the two tensor indices of \( \psi_{\mu \nu} \) are different from the derivative index, we have the following two possible products ([23], p43):

\[
L_1 = \partial_\sigma \psi_{\mu \nu} \partial^\sigma \psi^{\mu \nu}, \quad L_2 = \partial_\sigma \psi_{\mu \nu} \partial^\sigma \psi_\tau^{\nu \mu}, \quad (32)
\]

where \( \psi^{\mu \nu} = \eta^{\mu \lambda \nu \sigma} \psi_{\lambda \sigma} \) is the corresponding contravariant tensor of \( \psi_{\mu \nu} \).

If there are two indices of \( \psi_{\mu \nu} \) which are equal, or one of the indices of \( \psi_{\mu \nu} \) is the same as the derivative index, we may have the following three possible products ([23], p43):

\[
L_3 = \partial_\sigma \psi_{\mu \nu} \partial_\sigma \psi_\tau^{\nu \mu}, \quad L_4 = \partial^\mu \psi_{\mu \nu} \partial^\nu \psi, \quad L_5 = \partial_\lambda \psi^{\mu \nu} \psi, \quad (33)
\]

where \( \psi \) is the trace of \( \psi_{\mu \nu} \), i.e., \( \psi = \psi_\lambda \equiv \eta_{\rho \sigma} \psi^{\rho \sigma} \),

\[
\partial^\mu \equiv \eta^{\mu \nu} \partial_\nu = \left( \frac{\partial}{\partial x^0}, -\frac{\partial}{\partial x^1}, -\frac{\partial}{\partial x^2}, -\frac{\partial}{\partial x^3} \right). \quad (35)
\]

\( L_3 \) may be omitted because it can be converted to \( L_2 \) by integration by parts ([23], p43).
Proposition 3 Suppose that we have the following conditions
\[
\frac{\partial \psi_{00}}{\partial (ct)} \approx 0, \quad \frac{\partial \psi_{0i}}{\partial x^j} \approx 0.
\]
(36)

If we set
\[
c_1 = \frac{1}{2}, \quad c_2 = -2, \quad c_4 = -6, \quad c_5 = -\frac{3}{2},
\]
(37)
then we have
\[
c_1 L_1 + c_2 L_2 + c_4 L_4 + c_5 L_5 \approx \left( \nabla \psi_{00} - \frac{\partial \tilde{\psi}_0}{\partial (ct)} \right)^2 = \frac{1}{2} \rho_0 u^2.
\]
(38)

Proof of Proposition 3. Based on Eq.(22) and Eq.(36) and noticing \(\psi_{00} = \psi_{00}, \psi_{0i} = -\psi_{0i}\), we have
\[
L_1 \approx -(\nabla \psi_{00})^2 - 2 \left( \frac{\partial \tilde{\psi}_0}{\partial (ct)} \right)^2,
\]
(39)
\[
L_2 \approx -2(\nabla \psi_{00}) \cdot \frac{\partial \tilde{\psi}_0}{\partial (ct)} - \left( \frac{\partial \tilde{\psi}_0}{\partial (ct)} \right)^2,
\]
(40)
\[
L_3 \approx (\nabla \psi_{00}) \cdot \frac{\partial \tilde{\psi}_0}{\partial (ct)},
\]
(41)
\[
L_4 \approx -(\nabla \psi_{00})^2.
\]
(42)

Using Eqs.(39-42) and Eq.(37), we obtain Eq.(38). Proof ends. □

Inspired by W. Thirring [24] and R. P. Feynman ([23], p43), we introduce the following assumption.

Assumption 4 The Lagrangian \(L_0\) for free fields of the \(\Omega(0)\) substratum can be written as
\[
L_0 = c_1 L_1 + c_2 L_2 + c_4 L_4 + c_5 L_5 + L_{\text{more}},
\]
(43)
where \(c_1 = 1/2, \quad c_2 = -2, \quad c_4 = -6, \quad c_5 = -3/2, \quad L_{\text{more}}\) denotes those terms involving more than two derivatives of \(\psi_{\mu\nu}\).

V. INTERACTION TERMS OF THE LAGRANGIAN OF A SYSTEM OF THE \(\Omega(0)\) SUBSTRATUM, THE \(\Omega(1)\) SUBSTRATUM AND MATTER

In order to derive the field equation, we should explore the possible interaction terms of the Lagrangian of a system of the \(\Omega(0)\) substratum, the \(\Omega(1)\) substratum and matter. According to Assumption 2, the coefficient of viscosity \(\mu_0\) of the \(\Omega(0)\) substratum may be very small. Thus, we may regard the \(\Omega(0)\) substratum as an ideal fluid approximately. Then from Eq.(24) we have \(u = \nabla \varphi\). Ignoring the damping force \(\rho_0 Q \nabla \varphi\) in Eq.(2) and using \(u = \nabla \varphi\), Eq.(2) can be written as
\[
F_Q = -\rho_0 Q \nabla \varphi.
\]
(44)

A particle is modelled as a point sink of the \(\Omega(0)\) substratum [15, 21, 22]. Thus, the interaction term of the Lagrangian of a system of the \(\Omega(0)\) substratum and a particle can be written as
\[
L_{\text{int}} = \rho_0 Q \varphi.
\]
(45)

Thus, the interaction term of the Lagrangian of a system of the \(\Omega(0)\) substratum and continuously distributed particles can be written as
\[
L_{\text{int}} = -\rho_0 \rho_s \varphi.
\]
(46)
Putting Eq. (8) into Eq. (46), we have

\[ L_{\text{int}} = -\rho_m \Phi. \quad (47) \]

The 00 term of the energy-momentum tensor \( T_{\mu\nu}^m \) of a particle is \( T_{00}^m = \rho_mc^2 \). Thus, using Eq. (28), Eq. (47) can be written as

\[ L_{\text{int}} = f_0 \psi_{00} T_{00}^m, \quad (48) \]

where

\[ f_0 = \frac{1}{a_{00}c^2}. \quad (49) \]

From Eq. (49), Eq. (31) and Eq. (4), we have

\[ f_0 = \sqrt{\frac{2\rho_0q_0^2}{m_0^2c^4}} = \sqrt{\frac{8\pi\gamma_N}{c^4}}, \quad \frac{1}{a_{00}^2} = 8\pi\gamma_N. \quad (50) \]

Inspired by Eq. (48) and Eq. (21), we introduce the following assumption.

**Assumption 5** The interaction terms of the Lagrangian of a system of the \( \Omega(0) \) substratum, the \( \Omega(1) \) substratum and matter can be written in the following form.

\[ L_{\text{int}} = f_0 \psi_{\mu\nu} T_{\mu\nu}^m + f_0 \psi_{\mu\nu} T_{\mu\nu}^{\Omega(1)} + O[(f_0 \psi_{\mu\nu})^2], \quad (51) \]

where \( T_{\mu\nu}^m \) and \( T_{\mu\nu}^{\Omega(1)} \) are the contravariant energy-momentum tensors of the system of the matter and the \( \Omega(1) \) substratum respectively, \( O[(f_0 \psi_{\mu\nu})^2] \) denotes those terms which are small quantities of the order of \( (f_0 \psi_{\mu\nu})^2 \).

### VI. DERIVATION OF THE FIELD EQUATION

Based on Assumption 4 and 5, the total Lagrangian \( L_{\text{tot}} \) of a system of the \( \Omega(0) \) substratum, the \( \Omega(1) \) substratum and matter can be written as

\[ L_{\text{tot}} = \frac{1}{2} \partial_\lambda \psi_{\mu\nu} \partial^\lambda \psi_{\mu\nu} - 2 \partial_\lambda \psi_{\mu}\partial^\mu \psi^\lambda - 6 \partial^\mu \psi_{\mu} \partial^\nu \psi_{\nu} \\
- \frac{3}{2} \partial_\lambda \psi^\lambda = L_{\text{more}} + f_0 \psi_{\mu\nu}(T_{\mu\nu}^m + T_{\mu\nu}^{\Omega(1)}) \\
+ O[(f_0 \psi_{\mu\nu})^2]. \quad (52) \]

**Theorem 6** If we ignore those terms which are small quantities of the order of \( (f_0 \psi_{\mu\nu})^2 \) and those terms involving more than two derivatives of \( \psi_{\mu\nu} \) in Eq. (52), i.e., \( O[(f_0 \psi_{\mu\nu})^2] \) and \( L_{\text{more}} \), then the field equation for the total Lagrangian \( L_{\text{tot}} \) in Eq. (52) can be written as

\[ \partial_\alpha \partial^\alpha \psi_{\alpha\beta} - 2(\partial^\sigma \partial_\sigma \psi_{\alpha\beta} + \partial^\sigma \partial_\beta \psi_{\alpha\sigma}) - 6(\eta_{\alpha\beta} \partial_\sigma \partial_\lambda \psi_{\sigma\lambda} \\
+ 6 \partial_\alpha \partial_\beta \psi - 3\eta_{\alpha\beta} \partial_\sigma \partial^\sigma \psi = f_0(T_{\mu\nu}^m + T_{\mu\nu}^{\Omega(1)}). \quad (53) \]

**Proof of Theorem 6.** Starting from the Lagrangian in Eq. (52), we have the following Euler-Lagrange equation [32]

\[ \frac{\partial L_{\text{tot}}}{\partial \psi_{\alpha\beta}} - \frac{\partial}{\partial x^\sigma} \left( \frac{\partial L_{\text{tot}}}{\partial (\partial_\sigma \psi_{\alpha\beta})} \right) = 0. \quad (54) \]

We can verify the following results ([23], p.43; [24])

\[ \frac{\partial}{\partial x^\sigma} \left( \frac{\partial (\partial_\lambda \psi_{\mu\nu} \partial^\lambda \psi_{\mu\nu})}{\partial (\partial_\sigma \psi_{\alpha\beta})} \right) = 2\partial_\sigma \psi_{\alpha\beta}, \quad (55) \]

\[ \frac{\partial}{\partial x^\sigma} \left( \frac{\partial (\partial_\lambda \psi_{\mu}\partial^\mu \psi^\lambda)}{\partial (\partial_\sigma \psi_{\alpha\beta})} \right) = \partial^\sigma \partial_\alpha \psi_{\beta\sigma} + \partial^\sigma \partial_\beta \psi_{\alpha\sigma}, \quad (56) \]

\[ \frac{\partial}{\partial x^\sigma} \left( \frac{\partial (\partial^\mu \psi_{\mu\nu} \partial^\nu \psi)}{\partial (\partial_\sigma \psi_{\alpha\beta})} \right) = \partial_\alpha \partial_\sigma \psi + \eta_{\alpha\beta} \partial_\sigma \partial_\lambda \psi_{\lambda\sigma}, \quad (57) \]

\[ \frac{\partial}{\partial x^\sigma} \left( \frac{\partial (\partial_\alpha \psi_{\lambda\sigma})}{\partial (\partial_\sigma \psi_{\alpha\beta})} \right) = 2\eta_{\alpha\beta} \partial_\sigma \partial^\sigma \psi, \quad (58) \]

\[ \frac{\partial L_{\text{tot}}}{\partial \psi_{\alpha\beta}} = f_0(T_{\alpha\beta}^m + T_{\alpha\beta}^{\Omega(1)}). \quad (59) \]
Putting Eq.(52) into Eq.(54) and using Eqs.(55-59), we obtain Eq.(53). Proof ends. □

For convenience, we introduce the following notation

\[ \Psi_{\mu\nu} = \partial_\lambda \partial_\lambda \psi_{\mu\nu} - 2 \partial_\lambda \partial_\mu \psi_{\nu\lambda} - 2 \partial_\lambda \partial_\nu \psi_{\mu\lambda} - 6 \eta^{\mu\nu} \partial_\sigma \partial_\lambda \psi_{\sigma\lambda} - 6 \partial_\mu \partial_\nu \psi - 3 \eta^{\mu\nu} \partial_\lambda \partial_\lambda \psi. \] (60)

Thus, the field equation Eq.(53) can be written as

\[ \Psi_{\mu\nu} = f_0(T_{m\mu\nu}^\nu + T_{\Omega(1)\mu\nu}^\nu). \] (61)

We introduce the following definition of the total energy-momentum tensor \( T_{\mu\nu}^{\Omega(0)} \) of the system of the matter, the \( \Omega(1) \) substratum and the \( \Omega(0) \) substratum

\[ T_{\mu\nu} = T_{m\mu\nu} + T_{\Omega(1)\mu\nu} + T_{\Omega(0)\mu\nu}, \] (62)

where \( T_{\mu\nu}^{\Omega(0)} \) is the energy-momentum tensor of the \( \Omega(0) \) substratum.

Adding the term \( f_0 T_{\Omega(0)\mu\nu} \) on both sides of Eq.(61) and using Eq.(62), the field equation Eq.(61) can be written as

\[ \Psi_{\mu\nu} + f_0 T_{\Omega(0)\mu\nu} = f_0 T_{\mu\nu}. \] (63)

For the total system of matter, the \( \Omega(1) \) substratum and the \( \Omega(0) \) substratum, the law of conservation of energy and momentum is ([26], p163; [28], p155)

\[ \partial_\mu T_{\mu\nu} = 0. \] (64)

Comparing Eq.(64) and Eq.(63), we have

\[ \partial_\mu (\Psi_{\mu\nu} + f_0 T_{\Omega(0)\mu\nu}) = 0. \] (65)

Noticing Eqs.(55-59), we introduce the following notation ([23], p43)

\[ H_{\mu\nu} = f_1 \partial_\lambda \partial_\lambda \psi_{\mu\nu} + f_2 (\partial_\lambda \partial_\mu \psi_{\nu\lambda} + \partial_\lambda \partial_\nu \psi_{\mu\lambda}) + f_3 (\partial_\mu \partial_\nu \psi + \eta^{\mu\nu} \partial_\sigma \partial_\lambda \psi_{\sigma\lambda}) + f_4 \psi_{\mu\nu} \partial_\lambda \partial_\lambda \psi, \] (66)

where \( f_i, i = 1, 2, 3, 4 \) are 4 arbitrary parameters.

If we require that

\[ \partial_\mu H_{\mu\nu} = 0, \] (67)

then, we can verify the following relationships ([23], p44; [24])

\[ f_1 + f_2 = 0, \quad f_2 + f_3 = 0, \quad f_3 + f_4 = 0. \] (68)

We choose \( f_1 = 1, f_2 = -1, f_3 = 1, f_4 = -1 \) in Eq.(66) and introduce the following notation

\[ \Theta_{\mu\nu} = \partial_\lambda \partial_\lambda \psi_{\mu\nu} - (\partial_\lambda \partial_\mu \psi_{\nu\lambda} + \partial_\lambda \partial_\nu \psi_{\mu\lambda}) + (\partial_\mu \partial_\nu \psi + \eta^{\mu\nu} \partial_\sigma \partial_\lambda \psi_{\sigma\lambda}) - \eta^{\mu\nu} \partial_\lambda \partial_\lambda \psi. \] (69)

We can verify the following result ([23], p44; [24])

\[ \partial_\mu \Theta_{\mu\nu} = 0. \] (70)

From Eq.(70) and Eq.(65), we have

\[ \partial_\mu \left( \frac{1}{f_0} \Psi_{\mu\nu} - \frac{b_0}{f_0} \Theta_{\mu\nu} + T_{\Omega(0)\mu\nu} \right) = 0. \] (71)

where \( b_0 \) is an arbitrary parameter.

Noticing Eq.(71), it is convenient for us to introduce the following definition of a tensor \( T_{\omega\mu}^{\nu} \)

\[ T_{\omega\mu}^{\nu} = \frac{1}{f_0} \Psi_{\mu\nu} - \frac{b_0}{f_0} \Theta_{\mu\nu} + T_{\Omega(0)\mu\nu} \] (72)
where \( b_0 \) is a parameter to be determined.

From Eq.(71), we have \( \partial_{\nu} T^\nu_{\mu} = 0 \). In the present stage, we have no idea about the physical meaning of the tensor \( T^\nu_{\mu} \). Later, once we have determined the value of the parameter \( b_0 \), we may explore the meaning of \( T^\nu_{\mu} \). Using Eq.(72), the field equation Eq.(63) can be written as

\[
\Theta^\mu_{\nu} = \frac{f_0}{b_0}(T^\mu_{\nu} - T^\nu_{\mu}).
\]  

(73)

Now our task is to determine the parameter \( b_0 \) in the field equation (73). A natural idea is that the 00 component of Eq.(73) reduces to the field equation Eq.(9) in the case that the velocity of the \( \Omega(0) \) substratum is much smaller than \( c \), i.e., in the low velocity limit. Thus, it is necessary for us to introduce an estimation of the value of \( T^\mu_{\nu} - T^\nu_{\mu} \) on the right hand side of Eq.(73) in the low velocity limit. To this end, we introduce the following speculation about the interaction between the \( \Omega(0) \) substratum and the \( \Omega(1) \) substratum.

**Assumption 7** In the low velocity limit, i.e., \( u/c \ll 1 \), where \( u = |\mathbf{u}| \), \( \mathbf{u} \) is the velocity of the \( \Omega(0) \) substratum, the following relationship is valid

\[
T^{\mu\nu}_{\Omega(1)} \approx \frac{1}{f_0} \Psi^{\mu\nu} - \frac{b_0}{f_0} \Theta^{\mu\nu},
\]  

(74)

where \( b_0 \) is a parameter to be determined.

Therefore, using Eq.(61) and Eq.(74), we have the following estimation of \( T^\mu_{\nu} \) in the low velocity limit

\[
T^\mu_{\nu} \approx \frac{b_0}{f_0} \Theta^\mu_{\nu}.
\]  

(75)

Using Eq.(63), Eq.(72) and Eq.(75), we have the following estimation of \( T^\mu_{\nu} - T^\nu_{\mu} \) in the low velocity limit

\[
T^\mu_{\nu} - T^\nu_{\mu} = \frac{b_0}{f_0} \Theta^\mu_{\nu} \approx T^\mu_{\nu}.
\]  

(76)

**Theorem 8** Suppose that Assumption 7 is valid. Then, \( b_0 = -1 \) and the field equation (53) can be written as

\[
\begin{align*}
\partial_{\lambda} \partial^\lambda \psi^{\mu\nu} - \partial_{\lambda} \partial^\mu \psi^{\nu\lambda} - \partial_{\lambda} \partial^\nu \psi^{\mu\lambda} + \partial^\mu \partial^\nu \psi + \\
\eta^{\mu\nu} \partial_{\alpha} \partial^\alpha \psi^{\sigma\lambda} - \eta^{\mu\nu} \partial_{\lambda} \partial^\alpha \psi = -f_0(T^\mu_{\nu} - T^\nu_{\mu}).
\end{align*}
\]  

(77)

**Proof of Theorem 8.** Noticing Eq.(69), the 00 component of the field equation (73) is

\[
\partial_{\lambda} \partial^\lambda \psi^{00} - 2\partial_{\lambda} \partial^\alpha \psi^{0\alpha} + \partial^0 \partial^0 \psi + \\
\partial_{\sigma} \partial_{\lambda} \psi^{\sigma\lambda} - \partial_{\lambda} \partial^\lambda \psi = \frac{f_0}{b_0}(T^{00} - T^\omega_{00}).
\]  

(78)

Take the trace of the field equation Eq.(73), we have

\[
\partial_{\sigma} \partial_{\lambda} \psi^{\sigma\lambda} - \partial_{\lambda} \partial^\lambda \psi = \frac{f_0}{2b_0}(T - T_{\omega}),
\]  

(79)

where \( T \) and \( T_{\omega} \) are the traces of \( T^\mu_{\nu} \) and \( T^\omega_{\nu} \) respectively, i.e., \( T = T^\lambda_{\lambda} = \eta_{\alpha\beta} T^{\alpha\beta} \), \( T_{\omega} = \eta_{\alpha\beta} T^{\alpha\beta}_{\omega} \).

Subtracting Eq.(79) from Eq.(78), we have

\[
\partial_{\lambda} \partial^\lambda \psi^{00} - 2\partial_{\lambda} \partial^\alpha \psi^{0\alpha} + \partial^0 \partial^0 \psi = \frac{f_0}{b_0} \left( T^{00} - \frac{T}{2} - T^\omega_{00} + \frac{T_{\omega}}{2} \right).
\]  

(80)

If the field is time-independent, then Eq.(80) reduces to

\[
-\nabla^2 \psi^{00} = \frac{f_0}{b_0} \left( T^{00} - \frac{T}{2} - T^\omega_{00} + \frac{T_{\omega}}{2} \right).
\]  

(81)

According to Eq.(76), we have the following estimations in the low velocity limit

\[
T^{00} - T^\omega_{00} \approx T^m_{00} = \rho_m c^2, \quad T - T_{\omega} \approx T_{m} \approx \rho_m c^2.
\]  

(82)
where $T_m$ is the trace of $T_{m}^\mu\nu$, i.e., $T_m \equiv \eta_{\alpha\beta}T_{m}^{\alpha\beta}$.

Using Eq.(28), Eq.(31), Eq.(50) and Eq.(82), Eq.(81) can be written as

$$\nabla^2 \Phi = \frac{1}{b_0} 4\pi \gamma N \rho_m.$$ (83)

Comparing Eq.(83) and Eq.(9), we obtain $b_0 = -1$. Therefore, using Eq.(69) and $b_0 = -1$, the field equation Eq.(73) can be written as Eq.(77). Proof ends. \(\square\)

Now we discuss the physical meaning of $T_{m}^\mu\nu$. Noticing Eq.(74) and Eq.(72), we have the following estimation in the low velocity limit

$$T_{m}^\mu\nu \approx T_{m(1)}^\mu\nu + T_{m(0)}^\mu\nu.$$ (84)

For convenience, we may call $T_{m}^\mu\nu \triangleq T_{m(1)}^\mu\nu + T_{m(0)}^\mu\nu$ the contravariant energy-momentum tensor of vacuum. From Eq.(84), we see that the tensor $T_{m}^\mu\nu$ is an estimation of $T_{m(1)}^\mu\nu$ when the velocity $u$ of the $\Omega(0)$ substratum is small comparing to $c$. Thus, we may call $T_{m}^\mu\nu$ the contravariant energy-momentum tensor of vacuum in the low velocity limit.

We introduce the following definition

$$\phi^\mu\nu = \psi^\mu\nu - \frac{1}{2} \eta^\mu\nu \psi.$$ (86)

Using Eq.(86), the field equation (77) can be written as

$$\partial_\lambda \partial_\mu \phi^\mu\nu - \partial_\mu \partial_\nu \phi^\nu\lambda - \partial_\lambda \partial_\nu \phi^\mu\lambda + \eta^\mu\nu \partial_\sigma \partial_\lambda \phi^{\sigma\lambda} = -f_0(T^\mu\nu - T_{m}^\mu\nu).$$ (87)

We introduce the following Hilbert gauge condition [24]

$$\partial_\mu \left( \psi^\mu\nu - \frac{1}{2} \eta^\mu\nu \psi \right) = 0.$$ (88)

Using Eq.(86), the Hilbert gauge condition Eq.(88) simplifies to

$$\partial_\mu \phi^\mu\nu = 0.$$ (89)

Applying Eq.(89) in Eq.(87), we obtain the following proposition [24].

**Proposition 9** If we impose the Hilbert gauge condition Eq.(88) on the fields, then, the field equation Eq.(77) simplifies to

$$\partial_\lambda \partial_\mu \left( \psi^\mu\nu - \frac{1}{2} \eta^\mu\nu \psi \right) = -f_0(T^\mu\nu - T_{m}^\mu\nu).$$ (90)

If the tensorial potential $\psi^\mu\nu$ does not satisfy the Hilbert gauge condition Eq.(88), then we can always construct a new tensorial potential $\tilde{\psi}^\mu\nu$ by the following gauge transformation [24]

$$\tilde{\psi}^\mu\nu = \psi^\mu\nu + \partial^\mu \Lambda^\nu + \partial^\nu \Lambda^\mu,$$ (91)

such that the new tensorial potential $\tilde{\psi}^\mu\nu$ does satisfy the Hilbert gauge condition Eq.(88).

Using Eq.(86), the field equation Eq.(90) can be written as

$$\partial_\lambda \partial_\mu \phi^\mu\nu = -f_0(T^\mu\nu - T_{m}^\mu\nu).$$ (92)

The field equation Eq.(92) can also be written as

$$\eta^{\alpha\beta} \frac{\partial^2 \phi^\mu\nu}{\partial x^\alpha \partial x^\beta} = -f_0(T^\mu\nu - T_{m}^\mu\nu).$$ (93)

We noticed that the tensorial field equation Eq.(93) is similar to the wave equation of electromagnetic fields.
VII. CONSTRUCTION OF A TENSORIAL POTENTIAL IN INERTIAL COORDINATE SYSTEMS

The existence of the $\Omega(1)$ substratum allows us to introduce the following definition of inertial coordinate systems.

**Definition 10** If a coordinates system $S$ is static or moving with a constant velocity relative to the reference frame $S_{\Omega(1)}$, then, we call such a coordinates system as an inertial coordinate system.

The field equations Eq.(87) and Eq.(90) are valid in the reference frame $S_{\Omega(1)}$. We will explore the possibility of constructing a tensorial potential in an arbitrary inertial system $S'$. In an inertial coordinate system $S$, an arbitrary event is characterized by the four space-time coordinates $(t, x, y, z)$. In an inertial system $S'$, this event is characterized by four other coordinates $(t', x', y', z')$. We assume that the origins of the Cartesian coordinates in the two inertial systems $S$ and $S'$ coincide at the time $t = t' = 0$. Then, the connections between these space-time coordinates are given by a homogeneous linear transformation keeping the quantity $s^2 = c^2t^2 - x^2 - y^2 - z^2$ invariant, i.e., ([26], p92)

$$s^2 = c^2t'^2 - x'^2 - y'^2 - z'^2 = c^2t^2 - x^2 - y^2 - z^2.$$

We introduce the following two coordinate systems

$$x^0 = ct, \quad x^1 = x, \quad x^2 = y, \quad x^3 = z,$$

$$x'^0 = ct', \quad x'^1 = x', \quad x'^2 = y', \quad x'^3 = z'.$$

The homogeneous linear transformation keeping the quantity $s^2$ invariant, which is usually called the Lorentz transformation, can be written as ([33], p57; [26], p92)

$$x'^\mu = \alpha'^\mu x^\mu,$$

where $\alpha'^\mu$ are coefficients depend only on the angles between the spatial axes in the two inertial systems $S$ and $S'$ and on the relative velocity of $S$ and $S'$.

Applying the standard methods in theory of special relativity [26], we have the following results.

**Proposition 11** Suppose that the field equation Eq.(92) is valid in the the reference frame $S_{\Omega(1)}$. Then, in an arbitrary inertial system $S'$, there exists a symmetric tensor $\phi'_{\mu\nu}$ satisfies the following wave equation

$$\partial'_\lambda \partial'^\lambda \phi'_{\mu\nu} = -f_0(T'_{\mu\nu} - T'_\omega\omega),$$

where $T'_{\mu\nu}$ and $T'_\omega\omega$ are corresponding tensors of $T_{\mu\nu}$ and $T_{\omega\omega}$ in the arbitrary inertial coordinate system $S'$ respectively.

**Proposition 12** Suppose that the field equation Eq.(87) is valid in the reference frame $S_{\Omega(1)}$. Then, in an arbitrary inertial system $S'$, there exists a symmetric tensor $\phi'_{\mu\nu}$ satisfies the following field equation

$$\partial'_\lambda \partial'^\lambda \phi'_{\mu\nu} + \partial'_\lambda \partial'^\mu \phi'_{\nu\lambda} - \partial'_\lambda \partial'^\nu \phi'_{\mu\lambda}$$

$$+ \eta_{\mu\nu} \partial'_\sigma \partial'^\sigma \phi'_{\mu\lambda} = -f_0(T'_{\mu\nu} - T'_\omega\omega).$$

VIII. THE EQUATION OF MOTION OF A POINT PARTICLE IN A GRAVITATIONAL FIELD AND INTRODUCTION OF AN EFFECTIVE RIEMANNIAN SPACETIME

In this section, we study the equation of motion of a free point particle in a gravitational field. The Lagrangian of a free point particle can be written as ([23], p57;[24])

$$L_0 = \frac{1}{2} m \frac{dx^\mu}{d\tau} \frac{dx^\mu}{d\tau} = \frac{1}{2} m u^\mu u_\mu = \frac{1}{2} m \eta_{\mu\nu} u^\mu u^\nu,$$

where $m$ is the rest mass of the point particle, $\tau \equiv \sqrt{dx^\mu dx_\mu}$ is the proper time interval, $u^\mu \equiv dx^\mu/d\tau$.

Suppose that $T'_{\mu\nu}(\Omega(1)) \approx 0$. Ignoring those higher terms $O([f_0 \psi_{\mu\nu}]^2)$ in Eq.(51), the interaction term of the Lagrangian of a system of the $\Omega(0)$ substratum, the $\Omega(1)$ substratum and the point particle can be written in the following form ([23], p57;[24])

$$L_{int} = f_0 \psi_{\mu\nu} m u^\mu u^\nu.$$
Using Eq.(100) and Eq.(99), the total Lagrangian $L_{\text{tot}}$ of a system of the $\Omega(0)$ substratum, the $\Omega(1)$ substratum and the point particle can be written as ([23], p57)

$$L_t = L_0 + L_{\text{int}} = \frac{1}{2} \mu \psi_{\mu \nu} \mu \psi_{\mu \nu}.$$

(101)

The Euler-Lagrange equation for the total Lagrangian $L_t$ can be written as ([33], p111)

$$\frac{d}{d\tau} \left[ \left( \eta_{\mu \nu} + 2 f_0 \psi_{\mu \nu} \right) \frac{d\chi^{\nu}}{d\tau} \right] - f_0 \frac{\partial \psi_{\alpha \beta}}{\partial x^{\mu}} \frac{d \chi^{\alpha}}{d\tau} \frac{d \chi^{\beta}}{d\tau} = 0.$$

(102)

We notice that the equation of motion (102) of a point particle in gravitational field is similar to the equation of a geodesic line (104) in a Riemannian spacetime. Thus, it is natural for us to introduce the following definition of a metric tensor $g_{\mu \nu}$ of a Riemannian spacetime ([23], p57)

$$g_{\mu \nu} = \eta_{\mu \nu} + 2 f_0 \psi_{\mu \nu}.$$

(103)

Then, the equation of motion Eq.(102) can be approximately written as ([23], p58)

$$\frac{d}{d\tau_g} \left( g_{\mu \nu} \frac{d\chi^{\nu}}{d\tau_g} \right) = \frac{1}{2} \frac{\partial g_{\alpha \beta}}{\partial x^{\mu}} \frac{d \chi^{\alpha}}{d\tau_g} \frac{d \chi^{\beta}}{d\tau_g},$$

where $\tau_g$ is the proper time interval in the Riemannian spacetime with a metric tensor $g_{\mu \nu}$.

Eq.(104) is a geodesic line in a Riemannian spacetime with a metric tensor $g_{\mu \nu}$, which can also be written as ([34], p51)

$$\frac{d^2 x^{\mu}}{d\tau_g^2} + G^\mu_{\nu \sigma} \frac{d \chi^{\nu}}{d\tau_g} \frac{d \chi^{\sigma}}{d\tau_g} = 0,$$

(105)

where

$$\Gamma^\nu_{\mu \beta} = \frac{1}{2} g^{\mu \nu} \left( \frac{\partial g_{\mu \alpha}}{\partial x^{\beta}} + \frac{\partial g_{\nu \beta}}{\partial x^{\alpha}} - \frac{\partial g_{\alpha \beta}}{\partial x^{\mu}} \right).$$

(106)

are the Christoffel symbols.

Thus, we find that the equation of motion (102) of a point particle in gravitational field is approximately a geodesic line described in Eq.(105) in a Riemannian spacetime with a metric tensor $g_{\mu \nu}$.

According to Assumption 1, the particles that constitute the $\Omega(1)$ substratum are sinks in the $\Omega(0)$ substratum. Thus, the movements of the $\Omega(1)$ substratum in gravitational field will be different from the Maxwell’s equations. We notice that the equation of motion of a point particle in gravitational field (104) is a generalization of the equation of motion of a point particle in vacuum free of gravitational field. The law of propagation of an electromagnetic wave front in vacuum free of gravitational field is Eq.(10). Thus, the law of propagation of an electromagnetic wave front in gravitational field may be a kind of generalization of Eq.(10). Therefore, we introduce the following assumption.

**Assumption 13** To the first order of $f_0 \psi_{\mu \nu}$, the law of propagation of an electromagnetic wave front $\omega(x_0, x_1, x_2, x_3)$ in gravitational field is

$$g_{\mu \nu} \frac{\partial \omega}{\partial x^\mu} \frac{\partial \omega}{\partial x^\nu} = 0,$$

(107)

where $\omega(x_0, x_1, x_2, x_3)$ is the electromagnetic wave front, $g_{\alpha \beta}$ is the metric tensor defined in Eq.(103).

The measurements of spacetime intervals are carried out using light rays and point particles, which are only subject to inertial force and gravitation. Thus, according to Eq.(104) and Eq.(107), the physically observable metric of spacetime, to the first order of $f_0 \psi_{\mu \nu}$, is $g_{\mu \nu}$. Thus, the initial flat background spacetime with metric $\eta_{\mu \nu}$ is no longer physically observable [24].

If we can further derive the Einstein’s equation (1) using the definition (103) of a metric tensor $g_{\mu \nu}$ of a Riemannian spacetime, then, we may provide a geometrical interpretation of Einstein’s theory of gravitation based on the theory of vacuum mechanics [15, 21, 22]. This is the task of the next section.
IX. DERIVATION OF A GENERALIZED EINSTEIN EQUATION IN INERTIAL COORDINATE SYSTEMS

Definition 14 The Einstein tensor $G_{\mu\nu}$ is defined by

$$G_{\mu\nu} \triangleq R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R,$$  \hfill (108)

where $g_{\mu\nu}$ is a metric tensor of a Riemannian spacetime, $R_{\mu\nu}$ is the Ricci tensor, $R \triangleq g^{\mu\nu} R_{\mu\nu}$, $g^{\mu\nu}$ is the corresponding contravariant tensor of $g_{\mu\nu}$ such that $g_{\alpha\beta} g^{\alpha\beta} = \delta^\mu_\mu = g^0_0$ ([34], p40).

According to the geometrical interpretation of some theories of gravitation in flat spacetime [24], the physically observable metric $g_{\mu\nu}$ of spacetime in Eq.(103) can be written as

$$g^{\mu\nu} = \eta^{\mu\nu} - 2 f_0 \psi^{\mu\nu} + O[(f_0 \psi^{\mu\nu})^2].$$  \hfill (109)

Following the clue showed in Eq.(109) and noticing the methods of S. N. Gupta [35] and W. Thirring [24], we introduce the following definition of a metric tensor of a Riemannian spacetime.

Definition 15

$$\tilde{g}^{\mu\nu} \triangleq \sqrt{-g_0} g^{\mu\nu} \triangleq \eta^{\mu\nu} - 2 f_0 \phi^{\mu\nu},$$  \hfill (110)

where $g_0 = \text{Det} \ g_{\mu\nu}$.

We have the following expansion of the contravariant metric tensor $g^{\mu\nu}$ [35]

$$g^{\mu\nu} = \eta^{\mu\nu} - 2 f_0 \phi^{\mu\nu} + f_0 \eta^{\mu\nu} \eta_{\alpha\beta} \phi^{\alpha\beta} - 2 f_0^2 \eta_{\alpha\beta} \phi^{\alpha\beta} \phi^{\mu\nu} + f_0^2 \eta^{\mu\nu} \eta_{\alpha\sigma} \eta_{\beta\lambda} \phi^{\alpha\beta} \phi^{\lambda\sigma} + \frac{1}{2} f_0^2 \eta^{\mu\nu} \eta_{\alpha\beta} \eta_{\lambda\sigma} \phi^{\alpha\beta} \phi^{\lambda\sigma} + O[(f_0 \phi_{\alpha\beta})^3].$$  \hfill (111)

Definition 16 If $\phi^{\mu\nu}$ and their first and higher derivatives satisfy the following conditions

$$|2 f_0 \phi^{\mu\nu}| \ll 1, \hfill (112)$$

$$\left| \frac{\partial^n (2 f_0 \phi^{\mu\nu})}{\partial(x^\alpha)^n} \right| \ll 1, n = 1, 2, 3, \ldots \hfill (113)$$

then we call this filed $\phi^{\mu\nu}$ weak.

For weak fields, $\psi \approx \phi \approx 0$. Thus, $\phi^{\mu\nu} = \psi^{\mu\nu} - \frac{1}{2} \eta^{\mu\nu} \psi \approx \psi^{\mu\nu}$. From Eq.(111), we see that the definition (110) is compatible with Eq.(109).

Theorem 17 Suppose that Assumption 7 is valid. Then, in an arbitrary inertial coordinate system $S_i$, we have the following field equation

$$G^{\mu\nu} - \frac{1}{2g_0} \left( \sqrt{-g_0} g^{\alpha\beta} - \eta^{\alpha\beta} \right) \frac{\partial^2 (\sqrt{-g_0} \tilde{g}^{\mu\nu})}{\partial x^\alpha \partial x^\beta} - \frac{\sqrt{-g_0}}{2g_0} \left( \partial_{\psi} \psi^{\mu\nu} + \partial_{\phi} \phi^{\mu\nu} - \eta^{\mu\nu} \partial_{\psi} g_{\psi \psi} \right) - \Pi^{\alpha\beta} \Pi^{\mu\nu} + \frac{1}{2} \psi^{\mu\nu} - \frac{1}{2} g^{\mu\nu} (L + B) + B^{\mu\nu} = \frac{f_0^2}{g_0} (T^{\mu\nu} - T_0^{\mu\nu}),$$  \hfill (114)

where $T^{\mu\nu}$ is the contravariant total energy-momentum tensor of the system of the matter, the $\Omega(1)$ substratum and the $\Omega(0)$ substratum in the inertial coordinate system $S_i$, $T_0^{\mu\nu}$ is the contravariant energy-momentum tensor of vacuum in the low velocity limit in $S_i$,

$$\Pi^{\mu\alpha\beta} \triangleq - \frac{1}{2g_0} \left( \tilde{g}^{\alpha\lambda} \frac{\partial \tilde{g}^{\beta\lambda}}{\partial x^\alpha} + \tilde{g}^{\beta\lambda} \frac{\partial \tilde{g}^{\alpha\lambda}}{\partial x^\beta} - \tilde{g}^{\alpha\lambda} \frac{\partial \tilde{g}^{\beta\lambda}}{\partial x^\alpha} \right),$$  \hfill (115)
\[ \Pi_{\alpha\beta} \triangleq g_{\alpha\lambda}g_{\beta\sigma}\Pi^{\lambda\sigma}, \]  
(116)  
\[ \Gamma^\alpha \triangleq g^{\sigma\lambda}\Gamma_{\sigma\lambda}^\alpha, \]  
(117)  
\[ \Gamma^{\mu\nu} \triangleq \frac{1}{2} \left( g^{\mu\alpha}\partial\Gamma^{\nu}_{\alpha} + g^{\nu\sigma}\partial\Gamma^{\mu}_{\sigma} - \partial g^{\mu\nu}\Gamma^{\alpha}_{\alpha} \right), \]  
(118)  
\[ y^\alpha \triangleq g^{\alpha\beta}y_\beta, \]  
(119)  
\[ L \triangleq -\frac{1}{2} \Gamma^\alpha_{\alpha\beta} \frac{\partial g^{\alpha\beta}}{\partial x^\nu} + \Gamma^\alpha_{\nu} \frac{\partial(\log\sqrt{-g_0})}{\partial x^\alpha}, \]  
(120)  
\[ B^{\mu\nu} \triangleq \Gamma^{\mu\nu} + \frac{1}{2} (y^\mu\Gamma^{\nu} + y^\nu\Gamma^\mu), \]  
(121)  
\[ \textbf{Proof of Theorem 17.} \]  
According to a theorem of V. Fock ([27], p429), the contravariant Einstein tensor \( G^{\mu\nu} \) can be written as  
\[ G^{\mu\nu} = \frac{1}{2g_0^2} g^{\alpha\beta} \frac{\partial^2 g^{\mu\nu}}{\partial x_\alpha \partial x_\beta} + \Pi^{\mu,\alpha\beta}\Pi_{\alpha\beta} - \frac{1}{2} g^{\mu\nu}(L + B) - B^{\mu\nu}. \]  
(122)  
Applying Eq.(110), Eq.(122) can be written as  
\[ G^{\mu\nu} = \frac{1}{2g_0^2} \left( \sqrt{-g_0}g^{\alpha\beta} - \eta^{\alpha\beta} \right) \frac{\partial^2 (-2f_0\phi^{\mu\nu})}{\partial x^\alpha \partial x^\beta} \]  
\[ - \frac{f_0}{g_0} \eta^{\alpha\beta} \frac{\partial^2 \phi^{\mu\nu}}{\partial x^\alpha \partial x^\beta} + \Pi^{\mu,\alpha\beta}\Pi_{\alpha\beta} \]  
\[ - \frac{1}{2} g^{\mu\nu}(L + B) - B^{\mu\nu}. \]  
(123)  
Noticing Eq.(110), the field equation Eq.(98) can be written as  
\[ \eta^{\alpha\beta} \frac{\partial^2 \phi^{\mu\nu}}{\partial x^\alpha \partial x^\beta} = - \frac{\sqrt{-g_0}}{2f_0} \left( \partial_\lambda \partial^\mu g^{\nu\lambda} + \partial_\lambda \partial^{\nu\mu} g^{\alpha\lambda} - \eta^{\mu\nu} \partial_\sigma \partial_\lambda g^{\sigma\lambda} \right) - f_0(\mathcal{T}^{\mu\nu} - T^{\mu\nu}_\omega). \]  
(124)  
Using Eq.(110) and Eq.(124), Eq.(123) can be written as  
\[ G^{\mu\nu} = \frac{1}{2g_0^2} \left( \sqrt{-g_0}g^{\alpha\beta} - \eta^{\alpha\beta} \right) \frac{\partial^2 \left( \sqrt{-g_0}g^{\mu\nu} \right)}{\partial x^\alpha \partial x^\beta} \]  
\[ + \frac{\sqrt{-g_0}}{2g_0} \left( \partial_\lambda \partial^\mu g^{\nu\lambda} + \partial_\lambda \partial^{\nu\mu} g^{\alpha\lambda} - \eta^{\mu\nu} \partial_\sigma \partial_\lambda g^{\sigma\lambda} \right) \]  
\[ + \frac{f_0}{g_0} (\mathcal{T}^{\mu\nu} - T^{\mu\nu}_\omega) + \Pi^{\mu,\alpha\beta}\Pi_{\alpha\beta} - \frac{1}{2} g^{\mu\nu}(L + B) - B^{\mu\nu}. \]  
(125)  
Eq.(125) can be written as Eq.(114). Proof ends. □
Theorem 18 If we impose the Hilbert gauge Eq.(88) on the fields, then in an arbitrary inertial coordinate system $S_i$ we have the following field equation

$$G^{\mu\nu} - \frac{1}{2g_0} \left( \sqrt{-g_0} g^{\alpha\beta} - \eta^{\alpha \beta} \right) \frac{\partial^2}{\partial x^{\alpha} \partial x^{\beta}} \left( \sqrt{-g_0} g^{\mu\nu} \right) $$

$$- \Pi^{\mu,\alpha\beta} \Pi^{\nu}_{\alpha\beta} + \frac{1}{2} y^{\mu} y^{\nu} - \frac{1}{2} g^{\mu\nu} (L + B)$$

$$+ B^{\mu\nu} = \frac{f_0^2}{g_0} (T^{\mu\nu} - T^{\mu\nu}_\omega).$$

(126)

Proof of Theorem 18. Using Eq.(110) and Eq.(97), Eq.(123) can be written as

$$G^{\mu\nu} = \frac{1}{2g_0} \left( \sqrt{-g_0} g^{\alpha\beta} - \eta^{\alpha \beta} \right) \frac{\partial^2}{\partial x^{\alpha} \partial x^{\beta}} \left( \sqrt{-g_0} g^{\mu\nu} \right) $$

$$- \frac{f_0^2}{g_0} (T^{\mu\nu} - T^{\mu\nu}_\omega) + \Pi^{\mu,\alpha\beta} \Pi^{\nu}_{\alpha\beta} - \frac{1}{2} y^{\mu} y^{\nu}$$

$$+ \frac{1}{2} g^{\mu\nu} (L + B) - B^{\mu\nu}.$$  

(127)

Eq.(127) can be written as Eq.(126). Proof ends. □

Definition 19 If each of the coordinates $x^{\alpha}$ satisfies the following generalized wave equation

$$\frac{1}{\sqrt{-g_0}} \frac{\partial}{\partial x^{\mu}} \left( \frac{\sqrt{-g_0} g^{\mu\nu} \partial x^{\alpha}}{\partial x^{\nu}} \right) = 0,$$  

(128)

then, we call such a coordinates system harmonic.

In a harmonic coordinates system, we have ([27], p254)

$$\Gamma^{\nu} = \Gamma^{\mu\nu} = B^{\mu\nu} = B = 0.$$  

(129)

Putting Eq.(129) into Eq.(126), we have the following corollary.

Corollary 20 If we apply the Hilbert gauge Eq.(88) and the coordinates system is harmonic, then the field equation Eq.(126) can be written as

$$G^{\mu\nu} = \frac{1}{2g_0} \left( \sqrt{-g_0} g^{\alpha\beta} - \eta^{\alpha \beta} \right) \frac{\partial^2}{\partial x^{\alpha} \partial x^{\beta}} \left( \sqrt{-g_0} g^{\mu\nu} \right) $$

$$- \Pi^{\mu,\alpha\beta} \Pi^{\nu}_{\alpha\beta} + \frac{1}{2} y^{\mu} y^{\nu} - \frac{1}{2} g^{\mu\nu} L$$

$$= \frac{f_0^2}{g_0} (T^{\mu\nu} - T^{\mu\nu}_\omega).$$  

(130)

We can verify that each of the Galilean coordinates is harmonic. Any constant and any linear function of harmonic coordinates satisfy Eq.(128). Thus, from Eq.(96) we see that an inertial coordinate system is harmonic and Eq.(130) is valid for every inertial system. In order to study the case of weak fields in inertial systems, we introduce the following assumption.

Assumption 21 Suppose that the dimensionless parameter $\varpi = m_0c/2q_0g_0$ satisfies the following condition

$$\varpi = \frac{m_0c}{2q_0g_0} \leq 1.$$  

(131)

Using the 00 component of Eq.(113) for the case $n = 1$ and noticing Eq.(86), Eq.(28), Eq.(50) and Eq.(8), we have

$$\left| \frac{\partial (2f_0 \phi^{00})}{\partial (x^{00})} \right| = \left| \frac{2q_0g_0}{m_0c^2} \frac{\partial \phi}{\partial x^0} \right| \ll 1.$$  

(132)

Noticing Eq.(26) and using Eq.(132) and Eq.(131), we have $|u| \approx |\nabla \varphi| \ll m_0c^2/(2q_0g_0) \leq c$. Therefore, according to Assumption 7, Eq.(74) and Eq.(76) are valid for weak fields.
Corollary 22  Suppose that (1) the Hilbert gauge Eq.(88) is applied on the fields; (2) the filed is weak; (3) Assumption 7 is valid. Then in an arbitrary inertial coordinate system the field equation Eq.(130) reduces to

$$R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R = \frac{f_0^2}{g_0}T_m^m.$$  

(133)

**Proof of Corollary 22.**  According to Definition 16, $f_0\phi^{\mu\nu}$ and their first and higher derivatives are small quantities of order $\varepsilon$, where $|\varepsilon| \ll 1$ is a small quantity. Thus, using Eq.(110) and Eq.(111), we have the following estimation of the order of magnitude of the following quantities

$$\sqrt{-g_0g^{\mu\nu}} - \eta^{\mu\nu} \sim \varepsilon, \quad \frac{\partial g_{\mu\nu}}{\partial x^\alpha} \sim \frac{\partial g^{\mu\nu}}{\partial x^\alpha} \sim \varepsilon.$$  

(134)

From Eq.(110), we have the following estimation of the order of magnitude of the quantity

$$\frac{\partial^2}{\partial x^\alpha \partial x^\beta} (\sqrt{-g_0g^{\alpha\beta}}) \sim \varepsilon.$$  

(135)

Thus, using Eq.(134) and Eq.(135), we have the following estimation of the order of magnitude of the quantity

$$\left(\sqrt{-g_0g^{\alpha\beta}} - \eta^{\alpha\beta}\right) \frac{\partial^2}{\partial x^\alpha \partial x^\beta} (\sqrt{-g_0g^{\alpha\beta}}) \sim \varepsilon^2.$$  

(136)

From Eq.(115) and Eq.(116), we have the following estimation of the order of magnitude of the following quantities

$$\Pi^{\mu,\alpha\beta} \sim \Pi^{\nu,\alpha\beta} \sim \varepsilon.$$  

(137)

Using Eq.(119), we have the following relationship ([27], p143)

$$y^\beta = \Gamma^\nu_{\beta\nu}. \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \ quad
Corollary 23 Suppose that the following conditions are valid: (1) the Hilbert gauge Eq.(88) is applied on the fields; (2) the field is weak; (3) $g_{\mu\nu} \approx \eta_{\mu\nu}$; (4) Assumption 7 is valid. Then in an arbitrary inertial coordinate system the field equation Eq.(133) reduces to

$$R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R = -f_0^2 T^m_{\mu\nu}. \quad (146)$$

Proof of Corollary 23. Since $g_{\mu\nu} \approx \eta_{\mu\nu}$, $g_{\mu\nu} \approx \eta_{\mu\nu}$, we have $g_0 = \text{Det} g_{\mu\nu} \approx \text{Det} \eta_{\mu\nu} = -1$. Thus, Eq.(133) can be written as Eq.(146). Proof ends. □

If we introduce the following notation

$$\kappa = f_0^2 = \frac{8\pi\gamma N}{c^4}, \quad (147)$$

then, Eq.(146) coincides with Einstein’s equation Eq.(1). Thus, we see that the field equation Eq.(114) is a generalization of the Einstein’s equation Eq.(1) in inertial coordinate systems.

X. DERIVATION OF A GENERALIZED EINSTEIN EQUATION IN SOME NON-INERTIAL COORDINATE SYSTEMS

Now we consider an arbitrary non-inertial coordinate system $S_n$. We introduce an arbitrary curvilinear coordinates $(z_0, z_1, z_2, z_3)$ in the non-inertial coordinate system $S_n$. We do not know whether Theorem 18 is valid or not in the non-inertial coordinate system $S_n$.

Assumption 24 Suppose that in a non-inertial coordinate system $S_n$ there exists a symmetric tensor $\phi_{\mu\nu}$ which satisfies the following wave equation

$$\gamma^{\alpha\beta} \frac{\partial^2 \phi_{\mu\nu}}{\partial z_\alpha \partial z_\beta} = -f_0(T^{\mu\nu} - T^{\nu}_{\omega}), \quad (148)$$

where $\gamma_{\mu\nu}$ is the metric tensor of the non-inertial coordinate system $S_n$.

We introduce the following definition of a metric tensor of a Riemannian spacetime.

Definition 25

$$g^{\mu\nu} \overset{\text{def}}{=} \sqrt{-g_0} g^{\mu\nu} \overset{\text{def}}{=} \gamma^{\mu\nu} - 2f_0\phi^{\mu\nu}, \quad (149)$$

where $g_0 = \text{Det} g_{\mu\nu}$.

Theorem 26 Suppose that Assumption 24 is valid. Then, in the non-inertial coordinate system $S_n$, we have the following field equation

$$G^{\mu\nu} - \frac{1}{2g_0} \left( \sqrt{-g_0} g^{\alpha\beta} - \gamma^{\alpha\beta} \right) \frac{\partial^2 (\sqrt{-g_0} g^{\mu\nu})}{\partial z_\alpha \partial z_\beta} - \frac{1}{2g_0} \gamma^{\alpha\beta} \frac{\partial^2 \gamma_{\mu\nu}}{\partial z_\alpha \partial z_\beta} - \Pi^{\mu\alpha\beta} \Pi_{\nu\alpha\beta} + \frac{1}{2} y^\mu y^\nu$$

$$- \frac{1}{2} g^{\mu\nu} (L + B) + B^{\mu\nu} = \frac{f_0^2}{g_0} (T^{\mu\nu} - T^{\nu}_{\omega}), \quad (150)$$

where $T_{\mu\nu} = T^m_{\mu\nu} + T^{\Omega(1)}_{\mu\nu} + T^{\Omega(0)}_{\mu\nu}$ is total energy-momentum tensor of the matter, the $\Omega(1)$ substratum and the $\Omega(0)$ substratum in the non-inertial coordinate system $S_n$. 

Proof of Theorem 26. Using Eq.(149), Eq.(122) can be written as

\[ G^{\mu\nu} = \frac{1}{2g_0} \sqrt{-g_0 g^{\alpha\beta}} \frac{\partial^2 \left( \gamma^{\mu\nu} - 2f_0 \phi^{\mu\nu} \right)}{\partial z_\alpha \partial z_\beta} + \Pi^{\mu,\alpha\beta} \Pi^{\nu}_{\alpha\beta} \\
- \frac{1}{2} y^\mu y^\nu + \frac{1}{2} g^{\mu\nu} (L + B) - B^{\mu\nu} \\
= \frac{1}{2g_0} \left( \sqrt{-g_0 g^{\alpha\beta}} - \gamma^{\alpha\beta} + \gamma^\alpha_{\beta} \right) \frac{\partial^2 \left( -2f_0 \phi^{\mu\nu} \right)}{\partial z_\alpha \partial z_\beta} \\
+ \Pi^{\mu,\alpha\beta} \Pi^{\nu}_{\alpha\beta} - \frac{1}{2} y^\mu y^\nu + \frac{1}{2} g^{\mu\nu} (L + B) - B^{\mu\nu} \\
= \frac{1}{2g_0} \left( \sqrt{-g_0 g^{\alpha\beta}} - \gamma^{\alpha\beta} \right) \frac{\partial^2 \left( \gamma^{\mu\nu} - 2f_0 \phi^{\mu\nu} \right)}{\partial z_\alpha \partial z_\beta} \\
+ \Pi^{\mu,\alpha\beta} \Pi^{\nu}_{\alpha\beta} - \frac{1}{2} y^\mu y^\nu + \frac{1}{2} g^{\mu\nu} (L + B) - B^{\mu\nu}. \] (151)

Using Eq.(149) and Eq.(148), Eq.(151) can be written as Eq.(150). Proof ends.

We need to study the relationship between Eq.(150) and the Einstein field equation (1). Using Eq.(129) and Eq.(150), we have the following corollary.

Corollary 27 Suppose that (1) Assumption 24 is valid; (2) the coordinate system is harmonic. Then, in the non-inertial coordinate system \( S_n \), the field equation Eq.(150) can be written as

\[ G^{\mu\nu} - \frac{1}{2g_0} \left( \sqrt{-g_0 g^{\alpha\beta}} - \gamma^\alpha_{\beta} \right) \frac{\partial^2 \left( \sqrt{-g_0 g^{\mu\nu}} \right)}{\partial z_\alpha \partial z_\beta} \\
- \frac{1}{2g_0} \gamma^\alpha_{\beta} \frac{\partial^2 \gamma^{\mu\nu}}{\partial z_\alpha \partial z_\beta} - \Pi^{\mu,\alpha\beta} \Pi^{\nu}_{\alpha\beta} \\
+ \frac{1}{2} y^\mu y^\nu - \frac{1}{2} g^{\mu\nu} L = \frac{f_0^2}{g_0} \left( T^{\mu\nu} - T^\mu_{\omega} \right), \] (152)

Definition 28 If we have the following conditions

\[ |\gamma^{\mu\nu} - \eta^{\mu\nu}| \ll 1, \] (153)
\[ \frac{1}{2} \gamma^\alpha_{\beta} \frac{\partial^2 \gamma^{\mu\nu}}{\partial z_\alpha \partial z_\beta} \ll |f_0 (T^{\mu\nu} - T^\mu_{\omega})|, \] (154)

then we call this non-inertial coordinate system \( S_n \) quasi-inertial.

Using Eq.(156), Eqs.(153-154) and Eq.(152), we have the following corollary.

Corollary 29 Suppose that (1) Assumption 24 is valid; (2) the coordinate system is harmonic; (3) the non-inertial coordinate system \( S_n \) is quasi-inertial. Then, the field equation Eq.(152) can be written as

\[ G^{\mu\nu} - \frac{1}{2g_0} \left( \sqrt{-g_0 g^{\alpha\beta}} - \gamma^\alpha_{\beta} \right) \frac{\partial^2 \left( \sqrt{-g_0 g^{\mu\nu}} \right)}{\partial z_\alpha \partial z_\beta} \\
- \Pi^{\mu,\alpha\beta} \Pi^{\nu}_{\alpha\beta} + \frac{1}{2} y^\mu y^\nu - \frac{1}{2} g^{\mu\nu} L = \frac{f_0^2}{g_0} \left( T^{\mu\nu} - T^\mu_{\omega} \right). \] (155)

Eq.(155) is only valid approximately in a quasi-inertial and harmonic coordinate system \( S_n \). Now we consider weak fields.

Assumption 30 For weak fields in the non-inertial coordinate system \( S_n \), the following relationship is valid

\[ T^{\mu\nu} - T^\mu_{\omega} \approx T^{\mu\nu}_m. \] (156)

Similar to Corollary 22, we have the following result.
Corollary 31 Suppose that (1) the conditions in Theorem 26 are valid; (2) the coordinate system is harmonic; (3) the non-inertial coordinate system \( S_n \) is quasi-inertial; (4) the field is weak. Then, the field equation Eq.(155) reduces to
\[
R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R = \frac{f_0^2}{g_0} T^m_{\mu\nu}.
\] (157)

Similar to Corollary 23, we have the following result.

Corollary 32 Suppose that (1) Assumption 24 is valid; (2) the coordinate system is harmonic; (3) the non-inertial coordinate system \( S_n \) is quasi-inertial; (4) the field is weak; (5) \( g_{\mu\nu} \approx \eta_{\mu\nu} \). Then, the field equation Eq.(157) reduces to
\[
R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R = -\frac{f_0^2}{g_0} T^m_{\mu\nu}.
\] (158)

Comparing Eq.(158) and Eq.(1), we see that the field equation Eq.(150) is a generalization of the Einstein’s equation Eq.(1) in some special non-inertial coordinate systems.

XI. DISCUSSION

Although the field equation Eq.(114) and Eq.(150) are generalizations of the Einstein’s equation (1), there exists at least the following 8 differences between this theory and Einstein’s theory of general relativity.

1. In Einstein’s theory, Einstein’s equation (1) is an assumption [1, 2, 26]. Although Einstein introduced his new concept of gravitational aether ([36], p63-113), Einstein did not derive his equation (1) theoretically based on his new concept of the gravitational aether. In our theory, the two generalized Einstein’s equation Eq.(114) and Eq.(150) are derived by methods of special relativistic continuum mechanics based on some assumptions.

2. Although the theory of general relativity is a field theory of gravity, the definitions of gravitational fields are not based on continuum mechanics [1, 2, 26, 37–40]. Because of the absence of a continuum, the theory of general relativity may be regarded as a phenomenological theory of gravity [1, 2, 26]. In our theory, gravity is transmitted by the \( \Omega(0) \) substratum. The tensorial potential \( \psi_{\mu\nu} \) of gravitational fields are defined based on special relativistic continuum mechanics.

3. In Einstein’s theory, the concept of Riemannian spacetime is introduced together with the field equation (1) [1, 2, 26]. The theory of general relativity can not provide a physical definition of the metric tensor of the Riemannian spacetime. In our theory, the background spacetime is the Minkowski spacetime. However, the initial flat background spacetime is no longer physically observable. According to the equation of motion of a point particle in gravitational field (104), to the first order of \( f_0 \psi_{\mu\nu} \), the physically observable spacetime is a Riemannian spacetime with the metric tensor \( g_{\mu\nu} \). The metric tensor \( g_{\mu\nu} \) is defined based on the tensorial potential \( \psi_{\mu\nu} \) of gravitational fields.

4. The masses of particles are constants in Einstein’s theory of general relativity [1, 2, 26]. In our theory, the masses of particles are functions of time \( t \) [15].

5. The gravitational constant \( \gamma_N \) is a constant in Einstein’s theory of general relativity [1, 2, 26]. The theory of general relativity can not provide a derivation of \( \gamma_N \). In our theory, the parameter \( \gamma_N \) is derived theoretically. From Eq.(4), we see that \( \gamma_N \) depends on time \( t \).

6. In our theory, the parameter \( \gamma_N \) in Eq.(9) depends on the density \( \rho_0 \) of the \( \Omega(0) \) substratum. If \( \rho_0 \) varies from place to place, i.e., \( \rho_0 = \rho_0(t, x, y, z) \), then the space dependence of the gravitational constant \( \gamma_N \) can be seen from Eq.(4).

7. In Einstein’s theory, equation (1) is supposed to be valid in all coordinate systems [1, 2, 26]. In our theory, the generalized Einstein’s equation Eq.(114) is valid only in inertial coordinate systems. The second generalized Einstein’s equation Eq.(150) is valid only in some special non-inertial coordinate systems.

8. In Einstein’s theory, equation (1) is rigorous [1, 2, 26]. However, in our theory, Eq.(158) is valid approximately under some assumptions.

XII. CONCLUSION

We extend our previous theory of gravitation based on a sink flow model of particles by methods of special relativistic fluid mechanics. In inertial coordinate systems, we construct a tensorial potential of the \( \Omega(0) \) substratum. Based on some assumptions, we show that this tensorial potential satisfies the wave equation. Inspired by the equation of motion of a test particle, a definition of a metric tensor of a Riemannian spacetime is introduced. A generalized
Einstein’s equation in inertial coordinate systems is derived based on some assumptions. This equation reduces to Einstein’s equation in case of weak field in harmonic coordinate systems. In some special non-inertial coordinate systems, a second generalized Einstein’s equation is derived based on some assumptions. If the field is weak and the coordinate system is quasi-inertial and harmonic, the second generalized Einstein’s equation reduces to Einstein’s equation. Thus, this theory may also explains all the experiments which support the theory of general relativity. In our theory, gravity is transmitted by the Ω(0) substratum. The theory of general relativity can not provide a physical definition of the metric tensor of the Riemannian spacetime. In our theory, the background spacetime is the Minkowski spacetime. However, the flat background spacetime is no longer physically observable. According to the equation of motion of a point particle in gravitational field, to the first order, the physically observable spacetime is a Riemannian spacetime. The metric tensor of this Riemannian spacetime is defined based on the tensorial potential of gravitational fields.
