Abstract. In this article, authors introduce a new class of degenerate Hermite poly-Genocchi polynomials and give some identities of these polynomials related to the Stirling numbers of the second kind. Some implicit summation formulae and general symmetry identities are derived by using different analytical means and applying generating functions. These results extend some known summations and identities of degenerate Hermite poly-Bernoulli numbers and polynomials studied by Khan [8].

Keywords: Hermite polynomials, degenerate Hermite poly-Genocchi polynomials, summation formulae, symmetric identities.

2010 Mathematics Subject Classification.: 05A10, 05A15, 33C45, 33C99.

1. Introduction

The 2-variable Hermite-Kampé de Fériet polynomials (2VHKdFP) $H_n(x, y)$ [3, 5] are defined as

$$H_n(x, y) = n! \sum_{r=0}^{\left[\frac{n}{2}\right]} y^r x^{n-2r} \frac{r!}{(n-2r)!}.$$  \hspace{1cm} (1.1)

From (1.1) is

$$e^{xt+y^2} = \sum_{n=0}^{\infty} H_n(x, y) \frac{t^n}{n!}. \hspace{1cm} (1.2)$$

When $y = -1$ and $x$ is replaced by $2x$ in (1.2), the result reduces to ordinary Hermite polynomials $H_n(x)$ (see [1]).

The generating function for degenerate Hermite polynomials are given by

$$(1 + \lambda t)^{\frac{1}{2}} (1 + \lambda t^2)^{\frac{1}{2}} = \sum_{n=0}^{\infty} H_n(x, y; \lambda) \frac{t^n}{n!}, \hspace{1cm} (\text{see [8]}).$$ \hspace{1cm} (1.3)

where $\lambda \neq 0$. Since $$(1 + \lambda t)^{\frac{1}{2}} \rightarrow e^t \hspace{1cm} \text{as} \hspace{1cm} \lambda \rightarrow 0,$$ it is evident that (1.3) reduces to (1.2). That is $H_n(x, y)$ limiting case of $H_n(x, y; \lambda)$ when $\lambda \rightarrow 0$.

By equating coefficients of $t^n$ on both the sides of (1.3), the following representation of $H_n(x, y; \lambda)$ is obtained

$$H_n(x, y; \lambda) = n! \sum_{r=0}^{\left[\frac{n}{2}\right]} \left(-\frac{\lambda}{2}\right)^{n-2r} \left(-\frac{\lambda}{2}\right)_r \frac{(-\lambda)^{n-r}}{r!(n-2r)!}. \hspace{1cm} (1.4)$$

Since $\lim_{\lambda \rightarrow 0} H_n(x, y; \lambda) = H_n(x, y)$, (1.1) is a limiting case of (1.4).

The classical Genocchi numbers $G_n$, the classical Genocchi polynomials $G_n(x)$ and the generalized Genocchi polynomials $G_n^{(\alpha)}(x)$ of (real or complex) order $\alpha$ are
usually defined by means of the following generating functions (see for details [1], see also [8-14] and the references cited therein):

\[
\left(\frac{2t}{e^t+1}\right) = \sum_{n=0}^{\infty} G_n \frac{t^n}{n!} \quad (|t| < \pi),
\]

and

\[
\left(\frac{2t}{e^t+1}\right)^\alpha e^{xt} = \sum_{n=0}^{\infty} G_n^{(\alpha)} \frac{t^n}{n!} \quad (|t| < \pi; 1^\alpha = 1),
\]

with

\[
G_n^{(1)}(0) = G_n(0) = G_n,
\]

respectively.

For \( \lambda \in \mathbb{C} \), Carlitz [4] introduced the degenerate Bernoulli polynomials defined by

\[
\frac{t}{(1 + \lambda t)^{\frac{1}{\lambda}}} = 1 + \sum_{n=0}^{\infty} \beta_n(x; \lambda) \frac{t^n}{n!},
\]

so that

\[
\beta_n(x; \lambda) = \sum_{m=0}^{n} \binom{n}{m} \beta_m(\lambda) \frac{x^{n-m}}{\lambda^{n-m}}.
\]

When \( x = 0 \), \( \beta_n(\lambda) = \beta_n(0; \lambda) \) are called the degenerate Bernoulli numbers.

From (1.10), we note that

\[
\lim_{\lambda \to 0} \beta_n(x; \lambda) \frac{t^n}{n!} = \lim_{\lambda \to 0} \frac{t}{(1 + \lambda t)^{\frac{1}{\lambda}}} = \frac{t}{e^t - 1} e^{xt} = \sum_{n=0}^{\infty} B_n(x) \frac{t^n}{n!}.
\]

where \( B_n(x) \) are called the Bernoulli polynomials (see [7-14]).

The classical polylogarithm function \( \text{Li}_k(z) \) is

\[
\text{Li}_k(z) = \sum_{k=m}^{\infty} \frac{z^m}{m^k}, (k \in \mathbb{Z}) \quad (\text{see } [6, 10-13])
\]

so for \( k \leq 1 \),

\[
\text{Li}_k(z) = -\ln(1 - z), \quad \text{Li}_0(z) = \frac{z}{1 - z}, \quad \text{Li}_{-1}(z) = \frac{z}{(1-z)^2}, \ldots
\]

The poly-Bernoulli polynomials are given by

\[
\frac{\text{Li}_k(1 - e^{-t})}{e^t - 1} e^{xt} = \sum_{n=0}^{\infty} B_n^{(k)}(x) \frac{t^n}{n!}, \quad (\text{see } [2, 10, 13])
\]

For \( k = 1 \) in (1.13), we have

\[
\frac{\text{Li}_1(1 - e^{-t})}{e^t - 1} e^{xt} = \frac{t}{e^t - 1} e^{xt} = \sum_{n=0}^{\infty} B_n(x) \frac{t^n}{n!}.
\]

From (1.13) and (1.14), we have

\[
B_n^{(1)}(x) = B_n(x).
\]
Very recently, Khan [8] introduced the degenerate Hermite poly-Bernoulli polynomials of two variables $H_{n}^{(e^{t}-1)}(x, y; \lambda)$ defined by

$$
\frac{\text{Li}_k(1-e^{-t})}{(1+\lambda t)^{2} - 1} (1+\lambda t)^{x} (1+\lambda t^{2})^{y} \sum_{n=0}^{\infty} H_{n}^{(k)}(x, y; \lambda) \frac{t^{n}}{n!}
$$

(1.15)

Note that

$$
\lim_{\lambda \to 0} \frac{\text{Li}_k(1-e^{-t})}{(1+\lambda t)^{2} - 1} (1+\lambda t)^{x} (1+\lambda t^{2})^{y} \sum_{n=0}^{\infty} B_{n}^{(k)}(x, y) \frac{t^{n}}{n!}
$$

(1.16)

For $k = 1$ in (1.16), the result reduces to known result of Dattoli et al. [5].

We recall the following definition as follows:

The Stirling number of the first kind is given by

$$(x)_n = x(x - 1) \cdots (x - n + 1) = \sum_{l=0}^{n} S_1(n, l) x^l, \ (n \geq 0).$$

(1.17)

and the Stirling number of the second kind is defined by generating function to be

$$(e^t - 1)^n = n! \sum_{l=n}^{\infty} S_2(l, n) \frac{t^l}{l!}.$$  

(1.18)

A generalized falling factorial sum $\tau_k(n; \lambda)$ can be defined by the generating function [14]:

$$\sum_{k=0}^{\infty} \tau_k(n; \lambda) \frac{t^k}{k!} = \frac{1 - (1 + \lambda t)^{n+1}}{1 + (1 + \lambda t)^{x}}.$$  

(1.19)

where $\lim_{\lambda \to 0} \tau_k(n; \lambda) = T_k(n)$.

In this paper, we consider a new class of degenerate Hermite poly-Genocchi polynomials $H_{n}^{(k)}(x, y)$ and develop some elementary properties and derive some implicit formulae and symmetric identities for the degenerate Hermite poly-Genocchi polynomials by using different analytical means of their respective generating functions.

2. A new class of degenerate Hermite poly-Genocchi polynomials

For $\lambda \in \mathbb{C}, k \in \mathbb{Z}$, we consider the degenerate Hermite poly-Genocchi polynomials which are given by the generating function

$$
\frac{2\text{Li}_k(1-e^{-t})}{(1+\lambda t)^{2} + 1} (1+\lambda t)^{x} (1+\lambda t^{2})^{y} \sum_{n=0}^{\infty} G_{n, \lambda}^{(k)}(x, y) \frac{t^{n}}{n!}
$$

so that

$$H_{n}^{(k)}(x, y) = \sum_{m=0}^{n} \binom{n}{m} G_{m, \lambda}^{(k)} H_{n-m}(x, y; \lambda).$$  

(2.1)

(2.2)

When $x = y = 0$ in (2.1), $G_{n, \lambda}^{(k)} = H_{n, \lambda}^{(k)}(0, 0)$ are called the degenerate poly-Genocchi numbers. Note that

$$H_{n, \lambda}^{(k)}(x, y) = H_{n, \lambda}(x, y),$$

and

$$\lim_{\lambda \to 0} H_{n, \lambda}^{(k)}(x, y) = H_{n}^{(k)}(x, y), \ (k \in \mathbb{Z}).$$

(2.3)

where $H_{n}^{(k)}(x, y)$ are called the Hermite poly-Genocchi polynomials (see[12]).
For $y = 0$ in (2.1), we have
\[
2 \text{Li}_k(1 - e^{-t}) \left(1 + \lambda t\right) \hat{z} = \sum_{n=0}^{\infty} G_{n,\lambda}^{(k)}(x) \frac{t^n}{n!} \quad (\lambda \in \mathbb{C}, k \in \mathbb{Z}).
\]  

(2.4)

**Theorem 2.1.** For $n \geq 0$, we have
\[
hG_{n,\lambda}^{(2)}(x, y) = \sum_{m=0}^{n} \left( \begin{array}{c} n \\ m \end{array} \right) \frac{B_m m!}{m+1} hG_{n-m,\lambda}(x, y).
\]

(2.5)

**Proof.** Applying Definition (2.1), we have
\[
\sum_{n=0}^{\infty} hG_{n}^{(k)}(x, y; \lambda) \frac{t^n}{n!} = \frac{2 \text{Li}_k(1 - e^{-t})}{(1 + \lambda t \hat{z} + 1)} (1 + \lambda t \hat{z})
\]
\[
= \frac{2(1 + \lambda) \hat{z} (1 + \lambda t^2 \hat{z})}{(1 + \lambda t \hat{z} + 1)} \int_{0}^{t} \frac{1}{e^z - 1} dz \cdots dz \quad \text{for } (k-2)\text{-times}
\]

(2.6)

For $k = 2$ in (2.6), we have
\[
\sum_{n=0}^{\infty} hG_{n,\lambda}^{(2)}(x, y) \frac{t^n}{n!} = \frac{2(1 + \lambda) \hat{z} (1 + \lambda t^2 \hat{z})}{(1 + \lambda t \hat{z} + 1)} \int_{0}^{t} \frac{z}{e^z - 1} dz
\]
\[
= \left( \sum_{m=0}^{\infty} B_m \frac{t^n}{m+1} \right) \frac{2(1 + \lambda) \hat{z} (1 + \lambda t^2 \hat{z})}{(1 + \lambda t \hat{z} + 1)}
\]
\[
= \left( \sum_{m=0}^{\infty} B_m m! \frac{t^n}{m+1} \right) \left( \sum_{n=0}^{\infty} hG_{n,\lambda}(x, y) \frac{t^n}{n!} \right)
\]

Replacing $n$ by $n - m$ in above equation, we have
\[
= \sum_{n=0}^{\infty} \left( \sum_{m=0}^{n} \left( \begin{array}{c} n \\ m \end{array} \right) \frac{B_m m!}{m+1} hG_{n-m,\lambda}(x, y) \right) \frac{t^n}{n!}.
\]

On equating the coefficients of the like powers of $\frac{t^n}{n!}$ in the above equation, we get the result (2.5).

**Theorem 2.2.** For $n \geq 0$, we have
\[
hG_{n,\lambda}^{(k)}(x, y) = \sum_{p=0}^{n} \left( \begin{array}{c} n \\ p \end{array} \right) \sum_{l=1}^{p+1} \frac{(-1)^{l+p+1} l! S_2(p+1, l)}{l^k (p+1)} hG_{n-p,\lambda}(x, y).
\]

(2.7)

**Proof.** From equation (2.1), we have
\[
\sum_{n=0}^{\infty} hG_{n,\lambda}^{(k)}(x, y) \frac{t^n}{n!} = \left( \frac{\text{Li}_k(1 - e^{-t})}{t} \right) \frac{2l(1 + \lambda) \hat{z} (1 + \lambda t^2 \hat{z})}{(1 + \lambda t \hat{z} + 1)}
\]

(2.8)

Now
\[
\frac{1}{t} \text{Li}_k(1 - e^{-t}) = \frac{1}{t} \sum_{l=1}^{\infty} \frac{(1 - e^{-t})^l}{l^k} = \frac{1}{t} \sum_{l=1}^{\infty} \frac{(-1)^l}{l^k} (1 - e^{-t})^l
\]
\[
= \frac{1}{t} \sum_{l=1}^{\infty} \frac{(-1)^l}{l^k} \sum_{p=l}^{\infty} (-1)^p S_2(p, l) \frac{t^p}{p!}
\]
\[
= \frac{1}{t} \sum_{p=1}^{\infty} \sum_{l=1}^{p} \frac{(-1)^{l+p}}{l^k} S_2(p, l) \frac{t^p}{p!}
\]
Proof. From equation (2.1), we have

\[ H \sum_{n=0}^{\infty} \frac{(-1)^{l+p+1}}{l!} \frac{S_2(p+1,l)}{p+1} \frac{t^n}{n!} \]

(2.9)

From equations (2.8) and (2.9), we have

\[ \sum_{n=0}^{\infty} hG_{n,\lambda}(x,y) \frac{t^n}{n!} = \sum_{p=0}^{\infty} \left( \sum_{l=1}^{p+1} \frac{(-1)^{l+p+1}}{l!} \frac{S_2(p+1,l)}{p+1} \right) \frac{t^p}{p!} \left( \sum_{n=0}^{\infty} hG_{n,\lambda}(x,y) \frac{t^n}{n!} \right) \]

Replacing \( n \) by \( n - p \) in the r.h.s of above equation and comparing the coefficients of \( \frac{t^n}{n!} \), we get the result (2.7).

Theorem 2.3. For \( n \geq 1 \), we have

\[ hG_{n,\lambda}^{(k)}(x+1,y) + hG_{n,\lambda}^{(k)}(x,y) = 2 \sum_{p=1}^{n} \binom{n}{p} \left( \sum_{l=0}^{p-1} \frac{(-1)^{l+p+1}}{(l+1)!} (l+1)!S_2(p,l+1) \right) H_{n-p}(x,y;\lambda). \]

(2.10)

Proof. Using the definition (2.1), we have

\[ \sum_{n=0}^{\infty} hG_{n,\lambda}^{(k)}(x+1,y) \frac{t^n}{n!} + \sum_{n=0}^{\infty} hG_{n,\lambda}^{(k)}(x,y) \frac{t^n}{n!} = 2 \sum_{p=1}^{n} \binom{n}{p} \left( \sum_{l=0}^{p-1} \frac{(-1)^{l+p+1}}{(l+1)!} (l+1)!S_2(p,l+1) \right) \frac{t^p}{p!} (1 + \lambda t)^{\frac{1}{2}} \]

Replacing \( n \) by \( n - p \) in the above equation and comparing the coefficients of \( \frac{t^n}{n!} \), we get the result (2.10).

Theorem 2.4. For \( n \geq 0 \), \( d \in \mathbb{N} \) and \( k \in \mathbb{Z} \), we have

\[ hG_{n,\lambda}^{(k)}(x,y) = \sum_{a=0}^{d-1} \sum_{l=0}^{n-1} \sum_{p=1}^{l+1} \left( \frac{n}{l} \right) \frac{d^{m-l-1}(-1)^{l+p+1}p!S_2(l+1,p)}{p!l+1} hG_{n-l} \left( \frac{l+x}{d}, \frac{\lambda}{d} \right). \]

(2.11)

Proof. From equation (2.1), we can be written as

\[ \sum_{n=0}^{\infty} hG_{n,\lambda}^{(k)}(x,y) \frac{t^n}{n!} = \frac{2 \text{Li}_k(1 - e^{-t})}{(1 + \lambda t)^{\frac{1}{2}}} (1 + \lambda t)^{\frac{1}{2}} \]

\[ = \frac{2 \text{Li}_k(1 - e^{-t})}{(1 + \lambda t)^{\frac{1}{2}}} \sum_{a=0}^{d-1} (1 + \lambda t)^{\frac{1}{2}} \]

\[ = \left( \frac{\text{Li}_k(1 - e^{-t})}{t} \right) d \sum_{a=0}^{d-1} \frac{2dt}{(1 + \lambda t)^{\frac{1}{2}}} (1 + \lambda t)^{\frac{1}{2}} \]
function \((1 + t)^n\) we get the result \((3.1)\).

Proof. Applying the definition (2.1) to the term mite poly-Genocchi polynomials \(H_n\), we have

\[
\text{Theorem 3.2.}
\]

In this section, we establish some implicit summation formulae for degenerate Hermite poly-Genocchi polynomials \(H^{(k)}_{n,\lambda}(x, y)\) as follows.

**Theorem 3.1.** The following implicit summation formula involving degenerate Hermite poly-Genocchi polynomials \(H^{(k)}_{n,\lambda}(x, y)\) holds true:

\[
H^{(k)}_{n,\lambda}(x + u, y + w) = \sum_{m=0}^{n} \binom{n}{m} H^{(k)}_{n-m}(x, y) H_{m}(u, w; \lambda). \tag{3.1}
\]

**Proof.** By the definition of degenerate poly-Genocchi polynomials and the definition (1.3), we have

\[
\frac{2\text{Li}_k(1-e^{-t})}{(1+\lambda t)^{\frac{k}{2}} + 1} (1+\lambda t)^{\frac{k}{2}} = \left(\sum_{n=0}^{\infty} H^{(k)}_{n,\lambda}(x, y) \frac{t^n}{n!}\right) \left(\sum_{m=0}^{\infty} H_{m}(u, w; \lambda) \frac{t^m}{m!}\right)
\]

Replacing \(n\) by \(n-m\) in above equation and comparing the coefficients of \(\frac{t^n}{n!}\), we get the result (3.1).

**Theorem 3.2.** The following implicit summation formula involving degenerate Hermite poly-Genocchi polynomials \(H^{(k)}_{n,\lambda}(x, y)\) holds true:

\[
H^{(k)}_{n,\lambda}(x, y) = \sum_{m=0}^{n} \sum_{j=0}^{m} \binom{m}{j} \frac{(\frac{x}{\lambda})^{n-m-j} (-\frac{y}{\lambda})^{n-m-j} n!}{m! j! (n-2j-m)!}. \tag{3.2}
\]

**Proof.** Applying the definition (2.1) to the term \(\frac{2\text{Li}_k(1-e^{-t})}{(1+\lambda t)^{\frac{k}{2}} + 1}\) and expanding the function \((1+\lambda t)^{\frac{k}{2}}(1+\lambda t)^{\frac{k}{2}}\) at \(t = 0\) yields

\[
\frac{2\text{Li}_k(1-e^{-t})}{(1+\lambda t)^{\frac{k}{2}} + 1} (1+\lambda t)^{\frac{k}{2}} = \left(\sum_{m=0}^{\infty} G^{(k)}_{m,\lambda} \frac{t^m}{m!}\right) \left(\sum_{n=0}^{\infty} (-\frac{x}{\lambda})^n (-\lambda)^n \frac{(-\frac{y}{\lambda})^n}{n!}\right) \left(\sum_{j=0}^{\infty} (-\frac{y}{\lambda})^j (-\lambda^{2j}) j!\right)
\]

Replacing \(n\) by \(n-2j\), we have

\[
\sum_{n=0}^{\infty} H^{(k)}_{n,\lambda}(x, y) \frac{t^n}{n!}
\]

\[
= \sum_{n=0}^{\infty} \sum_{m=0}^{n-2j} \binom{n-2j}{m} G^{(k)}_{m,\lambda} \frac{(\frac{x}{\lambda})^{n-m-2j} (-\lambda)^{n-m-2j} (-\frac{y}{\lambda})^j}{n! (n-2j)! j!}. \tag{3.3}
\]
Equating their coefficients of \( \frac{t^n}{n!} \), we get the result (3.2).

**Theorem 3.3.** The following implicit summation formula involving degenerate Hermite poly-Genocchi polynomials \( HG_{n,\lambda}^{(k)}(x, y) \) holds true:

\[
HG_{n,\lambda}^{(k)}(x, y) = \sum_{n=0}^{\infty} H_{m,n,\lambda}^{(k)}(x - z, y) \frac{t^n}{n!} (m + 1)!
\]

Proof. By exploiting the generating function (2.1), we can write the equation

\[
\sum_{n=0}^{\infty} HG_{n,\lambda}^{(k)}(x, y) \frac{t^n}{n!} = \frac{2\text{Li}_k(1 - e^{-t})}{(1 + \lambda t)^{\frac{x}{2}} + 1} (1 + \lambda t)^{\frac{x+1}{2}} (1 + \lambda t)^{\frac{x}{2}} - 1
\]

Replacing \( n \) by \( n - m \) in above equation and equating their coefficients of \( \frac{t^n}{n!} \) leads to formula (3.4).

**Theorem 3.4.** The following implicit summation formula involving degenerate Hermite poly-Genocchi polynomials \( HG_{n,\lambda}^{(k)}(x, y) \) holds true:

\[
HG_{n,\lambda}^{(k)}(x + 1, y) = \sum_{n=0}^{\infty} \left( \begin{array}{c} n \\ r \end{array} \right) (-1)^r \lambda^r HG_{n-r,\lambda}^{(k)}(x, y).
\]

Proof. By the definition of degenerate Hermite poly-Genocchi polynomials, we have

\[
\sum_{n=0}^{\infty} HG_{n,\lambda}^{(k)}(x+1, y) \frac{t^n}{n!} = \sum_{n=0}^{\infty} HG_{n,\lambda}^{(k)}(x, y) \frac{t^n}{n!} = \frac{2\text{Li}_k(1 - e^{-t})}{(1 + \lambda t)^{\frac{x}{2}} + 1} (1 + \lambda t)^{\frac{x+1}{2}} (1 + \lambda t)^{\frac{x}{2}} - 1
\]

Finally, equating the coefficients of the like powers of \( \frac{t^n}{n!} \), we get (3.6).

4. **General symmetry identities for degenerate Hermite poly-Genocchi polynomials**

In this section, we give general symmetry identities for the degenerate poly-Genocchi polynomials \( G_{n,\lambda}^{(k)}(x) \) and the degenerate Hermite poly-Genocchi polynomials \( HG_{n,\lambda}^{(k)}(x, y) \) by applying the generating function (2.1) and (2.4).

**Theorem 4.1.** Let \( a, b > 0 \) and \( a \neq b \). For \( x, y \in \mathbb{R} \) and \( n \geq 0 \), the following identity holds true:

\[
\sum_{m=0}^{n} \left( \begin{array}{c} n \\ m \end{array} \right) b^{n-m} HG_{n-m,\lambda}^{(k)}(bx, b^2y) HG_{m,\lambda}^{(k)}(ax, a^2y)
\]

\[
= \sum_{m=0}^{n} \left( \begin{array}{c} n \\ m \end{array} \right) a^{n-m} HG_{n-m,\lambda}^{(k)}(ax, a^2y) HG_{m,\lambda}^{(k)}(bx, b^2y).
\]
Proof. Let

\[ g(t) = \left( 2\text{Li}_k(1 - e^{-at})2\text{Li}_k(1 - e^{-bt}) \right) \left( 1 + \lambda t \right)^{\frac{ab}{2}} \left( 1 + \lambda t^2 \right)^{\frac{\alpha a}{2}} \]  

(4.2)

Then the expression for \( g(t) \) is symmetric in \( a \) and \( b \) and we can expand \( g(t) \) into series in two ways to obtain

\[ g(t) = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} \frac{H_{n,m,\lambda}(bx,b^2y)}{n!} \frac{(bt)^m}{m!} \]

Similarly, we can show that

\[ g(t) = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} \frac{H_{n,m,\lambda}(ax,a^2y)}{n!} \frac{(at)^n}{n!} \]

Comparing the coefficients of \( \frac{t^n}{n!} \) on the right hand sides of the last two equations, we arrive the desired result.

Remark 1. On setting \( b = 1 \) in Theorem 4.1, we get the following result

\[ \sum_{m=0}^{\infty} \binom{n}{m} a^{n-m} H_{n-m,\lambda}(x,y) = \sum_{m=0}^{\infty} \binom{n}{m} a^{n-m} H_{n-m,\lambda}(x,y) \]

(4.3)

Theorem 4.2. For all integers \( a > 0, b > 0, \) and \( n \geq 0, \) the following identity holds true:

\[ \sum_{m=0}^{n} \binom{n}{m} a^{n-m} H_{n-m,\lambda}(bx,b^2z) \sum_{i=0}^{m} \binom{m}{i} \tau_i(a-1;\lambda) G_{m-i,\lambda}(by) \]

\[ = \sum_{m=0}^{n} \binom{n}{m} a^{n-m} H_{n-m,\lambda}(ax,a^2z) \sum_{i=0}^{m} \binom{m}{i} \tau_i(b-1;\lambda) G_{m-i,\lambda}(by). \]  

(4.4)

where generalized falling factorial sum \( \tau_k(n;\lambda) \) is given by (1.19).

Proof. We now use

\[ g(t) = \frac{2\text{Li}_k(1 - e^{-at})2\text{Li}_k(1 - e^{-bt})}{(1 + \lambda t^{\frac{ab}{2}} + 1)(1 + \lambda t^2)^{\frac{\alpha a}{2}}} \]  

to find that

\[ g(t) = \left( \frac{2\text{Li}_k(1 - e^{-at})}{(1 + \lambda t^{\frac{ab}{2}} + 1)} \right) \left( 1 + \lambda t^2 \right)^{\frac{\alpha a}{2}} \left( \frac{1 - (-1 + \lambda t^{\frac{ab}{2}})^{\frac{\alpha a}{2}}}{1 + \lambda t^2} \right) \]

\[ = \sum_{n=0}^{\infty} H_{n,\lambda}(bx,b^2z) \frac{(at)^n}{n!} \sum_{n=0}^{\infty} \tau_n(a-1;\lambda) \frac{(bt)^n}{n!} \sum_{n=0}^{\infty} G_{n,\lambda}(ay) \frac{(bt)^n}{n!} \]
By using a similar plan, we get
\[
g(t) = \sum_{n=0}^{\infty} \left( \sum_{m=0}^{n} \binom{n}{m} \frac{b^n}{n!} H_{n,\lambda}^{(k)}(ax, a^2x) \sum_{i=0}^{m} \binom{m}{i} \sum_{j=0}^{m} \binom{m}{j} \frac{t^n}{n!} \right). 
\]
(4.5)

After comparing the coefficients of $\frac{t^n}{n!}$ on the right hand sides of the last two equations, we arrive at the desired result.
