In the paper we show that the general relativity action (and Lagrangian) in recent Einstein-Palatini formulation is equivalent in four dimensions to the action (and Lagrangian) of a gauge field. We begin with a bit of information of the Einstein-Palatini (EP) action, then we present how Einstein fields equations can be derived from it. In the next section, we consider Einstein-Palatini action integral for general relativity with a positive cosmological constant $\Lambda$ in terms of the corrected curvature $\Omega_{\text{cor}}$. We will see that in terms of $\Omega_{\text{cor}}$ this action takes the form typical for a gauge field. Finally, we give a geometrical interpretation of the corrected curvature $\Omega_{\text{cor}}$.

Keywords: action integral, fiber bundle, connection in a principal fiber bundle and its curvature, pull-back of forms, Lie groups and their algebras.

1 Introduction: Einstein-Palatini action for general relativity

In this section we would like to remind briefly Einstein- Palatini formalism for general relativity (GR). The Einstein field equations can be derived by postulating the Einstein-Hilbert action to be the true action for GR. Albert Einstein firstly used only metric as a independent variable to do variation of this action. The connection in this approach to EH action is the metric and symmetric Levi-Civita connection. Later Einstein and Palatini proposed to take the metric and affine connection as independent variables in the action principle. This method allowed to compute the field equations for a more general metric affine connection rather than the Levi-Civita connection. Here the spacetime admitted torsion when matter Lagrangian explicitely depended on connection. Thus, the Einstein-Palatini formalism gave us a powerful tool for theories of gravitation which have more general Riemann-Cartan geometry.

In this section, we are going to present Einstein-Palatini action in recent formulation and how the Einstein fields equations can be computed from it.
The Einstein-Palatini action with cosmological constant $\Lambda$ in this new formulation [3] is defined as follows

$$S_{EP} = \frac{1}{4\kappa} \int_{\mathcal{D}} \left( \vartheta^i \wedge \vartheta^j \wedge \Omega^{kl} - \frac{\Lambda}{6} \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \right) \eta_{ijkl},$$

(1)

where $\Omega$ is the curvature of $\omega$ (spin connection) and $\kappa = 8\pi G/c^4$. All indices take values $(0, 1, 2, 3)$. $\mathcal{D}$ means an established 4-dimensional compact domain in spacetime. In the above formula $\vartheta^a$ denote 1-forms of the Lorentzian coreper in term of which the spacetime looks locally Minkowskian: $g = \eta_{ik} \vartheta^i \otimes \vartheta^k$, $\eta_{ik} = \text{diag}(1, -1, -1, -1)$. $\eta_{ijkl}$ is completely antisymmetric Levi-Civita pseudotensor: $\eta_{0123} = \sqrt{|g|}$, where $g := \text{det}(g_{ik})$. In a Lorentzian coreper $|g| = 1$. Spin connection $\omega$ is a general metric connection (or Levi-Civita connection) in Lorentzian coreper.

For the geometrical units $G = c = 1$ the above formula has the extended form

$$S_{EP} = \frac{1}{32\pi} \int_{\mathcal{D}} \eta_{ijkl} \vartheta^i \wedge \vartheta^j \wedge \Omega^{kl} - \frac{\Lambda}{192\pi} \int_{\mathcal{D}} \eta_{ijkl} \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l.$$

(2)

Let us denote by $S_1$ and $S_2$ two integrals in the above formula of the Einstein-Palatini action and compute their variations. From the integral

$$S_1 = \frac{1}{32\pi} \int_{\mathcal{D}} \eta_{ijkl} \vartheta^i \wedge \vartheta^j \wedge \Omega^{kl} = \frac{1}{16\pi} \int_{\mathcal{D}} \Omega^i_j \wedge \eta^j_i,$$

(3)

where $\eta^j_i$ is the 2-form defined in Appendix 1, we get

$$\delta S_1 = \frac{1}{16\pi} \int_{\mathcal{D}} \delta \left( \Omega^i_j \wedge \eta^j_i \right).$$

(4)

Below we give the method of computing $\delta \left( \Omega^i_j \wedge \eta^j_i \right)$ in Lorentzian coreper $\vartheta^i$ with spin connection $\omega^i_k$.

$$\rho \delta \left( \Omega^i_j \wedge \eta^j_i \right) = \rho \left( \delta \Omega^i_j \wedge \eta^j_i + \Omega^i_j \wedge \delta \eta^j_i \right),$$

(5)

where $\rho$ denotes $\frac{1}{2\kappa} = \frac{1}{16\pi}$.

Let us take the standard expressions

$$\Omega^i_j = d\omega^i_j + \omega^i_k \wedge \omega^k_j$$

(6)

and

$$\eta^j_i = g^{ijp} \eta_{jp}$$

$$= \frac{1}{2} g^{ijp} \vartheta^k \wedge \eta_{pk}$$

$$= \frac{1}{2} g^{ijp} \vartheta^k \wedge \vartheta^l \wedge \eta_{pkl}$$

$$= \frac{1}{2} g^{ijl} \eta_{lmn} \vartheta^m \wedge \vartheta^n.$$
\( \eta_{ip}, \eta_{ipk}, \eta_{ipkl} \) are forms firstly introduced by A. Trautman [11] (see Appendix 1). Then, we have

\[
\rho \delta \left( \Omega^i_j \wedge \eta_i^j \right) = \rho \left( \delta \omega^i_j \wedge \omega^i_k \wedge \omega^k_j + \omega^i_k \wedge \delta \omega^k_j \right) \wedge \eta_i^j + \rho \frac{1}{2} \Omega^i_j \wedge \delta \left( g^{ij} \eta_{ilmn} \vartheta^m \wedge \vartheta^n \right). \tag{8}
\]

Now we use the fact that \( \delta \) and \( d \) commute and that \( g^{ij} = \eta_{ilmn} = \text{const} \) in the coreper \( \vartheta^i \), so the subintegral expression in \( \delta S_1 \) has the following form

\[
\rho \delta \left( \Omega^i_j \wedge \eta_i^j \right) = \rho \left[ d \left( \delta \omega^i_j \wedge \eta_i^j \right) + \delta \omega^i_j \wedge \omega^i_k \wedge \eta_i^j + \omega^i_k \wedge \delta \omega^k_j \wedge \eta_i^j + \frac{1}{2} \Omega^i_j \wedge \eta_{ilmn} \wedge \delta \left( \vartheta^m \wedge \vartheta^n \right) \right]. \tag{9}
\]

Because

\[
\delta (\vartheta^m \wedge \vartheta^n) = \delta \vartheta^m \wedge \vartheta^n + \vartheta^m \wedge \delta \vartheta^n \tag{10}
\]

and

\[
d \left( \delta \omega^i_j \right) \wedge \eta_i^j = d \left( \delta \omega^i_j \wedge \eta_i^j \right) + \delta \omega^i_j \wedge d \eta_i^j \tag{11},
\]

so

\[
\rho \delta \left( \Omega^i_j \wedge \eta_i^j \right) = \rho \left[ d \left( \delta \omega^i_j \wedge \eta_i^j \right) + \delta \omega^i_j \wedge \omega^i_k \wedge \eta_i^j + \omega^i_k \wedge \delta \omega^k_j \wedge \eta_i^j \right]
+ \rho \left[ \frac{1}{2} \Omega^i_j \eta_{ilmn} \wedge (\delta \vartheta^m \wedge \vartheta^n + \vartheta^m \wedge \delta \vartheta^n) \right]; \tag{12}
\]

where \( \rho = \frac{1}{2\pi} = \frac{\kappa}{16\pi G} \).

Next, we use two laws given below:

\[
\omega_p \wedge \omega_q = (-1)^p q \omega_q \wedge \omega_p, \tag{13}
\]

\[
d \left( \omega_p \wedge \omega_q \right) = d \omega_p \wedge \omega_q + (-1)^p \omega_p \wedge d \omega_q \tag{14}
\]

and we change some indices. Then the variation of \( \rho \delta \left( \Omega^i_j \wedge \eta_i^j \right) \) has the form

\[
\rho \delta \left( \Omega^i_j \wedge \eta_i^j \right) = \rho \left[ d \left( \delta \omega^i_j \wedge \eta_i^j \right) \right]
+ \rho \left[ \frac{1}{2} \delta \omega^i_j \wedge 2 \left( d \eta_i^j + \omega^i_k \wedge \eta_i^k - \omega^k_i \wedge \eta_i^j \right) + \delta \vartheta^i \wedge \Omega^k_l \eta_{klmn} \wedge \vartheta^m \right]
= \delta \vartheta^i \wedge \rho \Omega^k_l \eta_{klmn} \wedge \vartheta^m + \frac{1}{2} \delta \omega^i_j \wedge 2 \rho \eta_j^i \wedge \vartheta^m + d \rho \delta \omega^i_j \wedge \eta_i^j \tag{15}
\]

where

\[
D \eta_j^i = d \eta_j^i + \omega_j^k \wedge \eta_j^k - \omega_j^k \wedge \eta_k^j. \tag{16}
\]
Finally, we get the following result

\[
\rho \delta \left( \Omega_j^i \wedge \eta_i \right) = \delta \vartheta^i \wedge \rho \Omega^{kl} \eta_{klm} \wedge \vartheta^m + \rho \delta \omega_j^i \wedge D \eta_i \wedge + d (\rho \delta \omega_j^i \wedge \eta_i).
\]

\[
= \delta \vartheta^i \wedge \rho \Omega^{kl} \eta_{kl} \wedge \rho \delta \omega_j^i \wedge D \eta_i \wedge + an \ exact \ form. \tag{17}
\]

The second integral from the Einstein-Palatini action

\[
S_2 = -\frac{\Lambda}{192 \pi} \int_D \eta_{ijkl} \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \tag{18}
\]

has the following variation

\[
\delta S_2 = -\frac{\Lambda}{192 \pi} \int_D 24 \delta \vartheta^i \wedge \eta_i
\]

\[
= -\frac{\Lambda}{8 \pi} \int_D \delta \vartheta^i \wedge \eta_i. \tag{19}
\]

It was computed in a similar way as the variation for the first integral \( S_1 \).

\[
\delta S_2 = -\frac{\Lambda}{192 \pi} \int_D \delta \left( \eta_{ijkl} \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \right)
\]

\[
= -\frac{\Lambda}{192 \pi} \int_D \eta_{ijkl} \delta \left( \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \right). \tag{20}
\]

where

\[
\delta \left( \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \right) =
\]

\[
= \delta \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l + \vartheta^i \wedge \delta \vartheta^j \wedge \vartheta^k \wedge \vartheta^l + \vartheta^i \wedge \vartheta^j \wedge \delta \vartheta^k \wedge \vartheta^l + \vartheta^k \wedge \delta \vartheta^l \wedge \vartheta^{ij}
\]

\[
= \delta \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l - \delta \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l + \delta \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l - \delta \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \tag{21}
\]

and

\[
\delta \left( \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \right) \eta_{ijkl} = 4 \vartheta^i \wedge \eta_{ijkl} \vartheta^j \wedge \vartheta^k \wedge \vartheta^l. \tag{22}
\]

Thus, the variation \( \delta S_2 \) finally equals

\[
\delta S_2 = -\frac{\Lambda}{192 \pi} \int_D 4 \delta \vartheta^i \wedge \eta_{ijkl} \vartheta^j \wedge \vartheta^k \wedge \vartheta^l. \tag{23}
\]

The expression \( \eta_{ijkl} \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \) is equal \( 6 \eta_i \) (see Appendix), so using this substitution we obtain as follows

\[
\delta S_2 = -\frac{\Lambda}{192 \pi} \int_D 24 \delta \vartheta^i \wedge \eta_i
\]

\[
= -\frac{\Lambda}{8 \pi} \int_D \delta \vartheta^i \wedge \eta_i. \tag{24}
\]
Joining both variations $\delta S_1$, $\delta S_2$ with the third variation $\delta S_m$ of the matter action $S_m = \int_D L_{\text{mat}}(\phi^A, D\phi^A, \vartheta^i)$, which we write in the form [11]

$$\delta S_m = \delta \int_D L_{\text{mat}}(\phi^A, D\phi^A, \vartheta^i)$$

$$= \int_D \left( \delta \vartheta^i \wedge t_i + \frac{1}{2} \delta \omega^i_j \wedge s_j^i + \delta \phi^A \wedge L_A + \text{an exact form} \right), \quad (25)$$

we obtain for total action, gravity and matter

$$\delta S = \delta S_1 + \delta S_2 + \delta S_m$$

$$= \int_D \left[ \frac{1}{8\pi} \delta \vartheta^i \wedge \left( \frac{1}{2} \Omega^{kl} \wedge \eta_{ki} - \Lambda \eta_i + 8\pi t_i \right) + \text{an exact form} \right]$$

$$+ \int_D \left[ \frac{1}{2} \delta \omega^i_j \wedge \left( \frac{1}{8\pi} D\eta^j_i + s_j^i \right) + \delta \phi^A \wedge L_A + \text{an exact form} \right]. \quad (26)$$

The form of the variation $\delta L_m = \delta \vartheta^i \wedge t_i + \frac{1}{2} \delta \omega^i_j \wedge s_j^i + \delta \phi^A \wedge L_A + \text{an exact form}$ defines the 3-forms $t_i$, $s_j^i$, $L^A$ of the energy-momentum, classical spin and the left hand side of the equations of motion for matter respectively. In the above formulas $\phi^A$ means tensor-valued matter form and $D\phi^A$ its absolute exterior derivative.

Einstein’s equations like all the other physical field equations arise due to variational principle, which is called the Principle of Stationary Action or Hamiltonian Principle. In our case it has the following form:

$$\delta S = \delta \int_\Omega \left( L_g + L_m \right) = 0, \quad (27)$$

where variations $\delta \vartheta^i$, $\delta \omega^i_j$ and $\delta \phi^A$ are vanishing on the boundary $\delta D$ of the compact domain $D$.

Here $L_g = \frac{1}{8\pi} \left( \Omega_{ij}^k \wedge \eta^i_j - 2\Lambda \eta_i \right)$ and represents the Lagrangian density of the gravitational field and $L_m$ is the Langrangian density of matter.

It is seen from above considerations that following Hamiltonian Principle

$$\delta S = \int_D \left[ \frac{1}{8\pi} \delta \vartheta^i \wedge \left( \frac{1}{2} \Omega^{kl} \wedge \eta_{ki} - \Lambda \eta_i + 8\pi t_i \right) + \text{an exact form} \right]$$

$$+ \int_D \left[ \frac{1}{2} \delta \omega^i_j \wedge \left( \frac{1}{8\pi} D\eta^j_i + s_j^i \right) + \delta \phi^A \wedge L_A + \text{an exact form} \right]$$

$$= 0 \quad (28)$$

The exact forms from this equation are eliminated with the help of Stoke’s integral theorem. As a consequence of Hamilton Principle, one gets two sets equations of gravitational
field
\[ \frac{1}{2} \Omega_{kli}^{kl} \wedge \eta_{kli} - \Lambda \eta_i + 8 \pi t_i = 0 \iff \frac{1}{2} \Omega_{kli}^{kl} \wedge \eta_{kli} - \Lambda \eta_i = -8 \pi t_i, \]  
(29) 
\[ \frac{1}{8 \pi} D \eta_i^j + s_i^j = 0 \iff D \eta_i^j = -8 \pi s_i^j \]  
(30)
and
\[ L_A = 0. \]  
(31)

\( L_A = 0 \) represent equations of motion for matter field. These equations are not intrinsic in further our considerations, so we will omit them. We are interested only in the gravitational field equations which are given by the equations (29)-(30).

In vacuum where \( t_i = s_i^j = 0 = \Rightarrow D \eta_i^j = 0 \) and we get the standard vacuum Einstein’s equations (EE) with cosmological constant \( \Lambda \) and pseudoriemannian geometry
\[ \frac{1}{2} \Omega_{kli}^{kl} \wedge \eta_{kli} - \Lambda \eta_i = 0. \]  
(32)

In general, we have the Einstein-Cartan equations and Riemann-Cartan geometry (a metric geometry with torsion).

The standard GR we obtain also if we put \( \frac{\delta L_m}{\delta \omega_i} = 0 = \Rightarrow s_i^k = 0 = \Rightarrow D \eta_i^k = 0. \) It is GR inside spinless matter with equations
\[ \frac{1}{2} \Omega_{kli}^{kl} \wedge \eta_{kli} - \Lambda \eta_i = -8 \pi t_i. \]  
(33)

One can show that \( \frac{1}{2} \Omega_{kli}^{kl} \wedge \eta_{kli} = -G_i^s \eta_s \) and \( t_i = T_i^s \eta_s \), where the Einstein tensor \( G_i^s \) is defined as follows
\[ G_i^s = R_i^s - \frac{1}{2} \delta_i^s R. \]  
(34)

Moreover, if \( s_i^k = 0 \) then the matter tensor \( T_i^s \), defined by the decomposition \( t_i = T_i^s \eta_s \), is symmetric, i.e. \( T_i^k = T^k_i \). Because \( \Lambda \eta_i = \Lambda \delta_i^s \eta_s \), then we get from (33)
\[ -G_i^s \eta_s - \Lambda \delta_i^s \eta_s = -8 \pi T_i^s \eta_s. \]  
(35)

Multiplying this equation by \(-1\) and omitting \( \eta_s \), we can see that there are Einstein equations with cosmological constant \( \Lambda \) in tensorial notation
\[ G_i^s + \Lambda \delta_i^s = 8 \pi T_i^s. \]  
(36)

If \( \Lambda = 0 \), then we obtain Einstein equations
\[ G_i^s = 8 \pi T_i^s \]  
(37)without cosmological constant.
2 Results: Einstein-Palatini action integral for General Relativity in vacuum and with positive cosmological constant $\Lambda$ as integral action for a gauge field

Now, getting back to Einstein-Palatini action in vacuum

$$S_{EP} = \frac{1}{4\kappa} \int \left( \vartheta^i \wedge \vartheta^j \wedge \Omega^{kl} - \frac{\Lambda}{6} \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \right) \eta_{ijkl}$$

$$= \frac{1}{4\kappa} \int \left( \vartheta^i \wedge \vartheta^j \wedge \Omega^{kl} \eta_{ijkl} - \frac{\Lambda}{6} \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \wedge \vartheta^l \eta_{ijkl} \right)$$

and using the definition of the duality operator $\star$ [1]

$$\star := -\frac{\eta_{ijkl}}{2} \implies \eta_{ijkl} = -2\star$$

one gets

$$\eta_{ijkl} \Omega^{kl} = -2\star \Omega_{ij},$$

$$\eta_{ijkl} \vartheta^k \wedge \vartheta^l = -2\star (\vartheta_i \wedge \vartheta_j).$$

Thus the Einstein-Palatini action has the following form

$$S_{EP} = -\frac{1}{2\kappa} \int \left( \vartheta^i \wedge \vartheta^j \wedge \star \Omega_{ij} - \frac{\Lambda}{6} \vartheta^i \wedge \vartheta^j \wedge \star (\vartheta_i \wedge \vartheta_j) \right)$$

$$= -\frac{1}{2\kappa} \int \text{tr} \left( \vartheta \wedge \vartheta \wedge \star \Omega - \frac{\Lambda}{6} \vartheta \wedge \vartheta \wedge \star (\vartheta \wedge \vartheta) \right).$$

Let us introduce the corrected curvature $\Omega_{cor}$

$$\Omega_{cor} := \Omega + \frac{\Lambda}{3} \vartheta \wedge \vartheta \implies \vartheta \wedge \vartheta = -\frac{3}{\Lambda} \left( \Omega - \Omega_{cor} \right).$$

Substituting the last formula into Einstein-Palatini action we get

$$S_{EP} = \frac{1}{2\kappa} \int \text{tr} \left( \vartheta \wedge \vartheta \wedge \star \Omega - \frac{\Lambda}{6} \vartheta \wedge \vartheta \wedge \star (\vartheta \wedge \vartheta) \right)$$

$$= \frac{1}{2\kappa} \int \text{tr} \left[ \frac{3}{\Lambda} (\Omega - \Omega_{cor}) \wedge \star \Omega - \frac{\Lambda}{6} \frac{9}{\Lambda} (\Omega - \Omega_{cor}) \wedge \star (\Omega - \Omega_{cor}) \right]$$

$$= \frac{3}{4\Lambda\kappa} \int \text{tr} \left[ 2(\Omega - \Omega_{cor}) \wedge \star \Omega - (\Omega - \Omega_{cor}) \wedge \star (\Omega - \Omega_{cor}) \right]$$

$$= \frac{3}{4\Lambda\kappa} \int \text{tr} \left[ 2\Omega \wedge \star \Omega - 2\Omega_{cor} \wedge \star \Omega - \Omega \wedge \star \Omega + \Omega_{cor} \wedge \star \Omega + \Omega \wedge \star \Omega_{cor} - \Omega_{cor} \wedge \star \Omega_{cor} \right]$$

$$= \frac{3}{4\Lambda\kappa} \int \text{tr} \left[ \Omega \wedge \star \Omega - \Omega_{cor} \wedge \star \Omega + \Omega \wedge \star \Omega_{cor} - \Omega_{cor} \wedge \star \Omega_{cor} \right]$$

$$= \frac{3}{4\Lambda\kappa} \int \text{tr} \left[ \Omega \wedge \star \Omega - \Omega_{cor} \wedge \star \Omega + \Omega \wedge \star \Omega_{cor} - \Omega_{cor} \wedge \star \Omega_{cor} \right]$$

(44)
Because $-\Omega_{cor} \wedge \star \Omega + \Omega \wedge \star \Omega_{cor}$ reduces, then we finally have

$$S_{EP} = \frac{3}{4\Lambda \kappa} \int_D tr \left[ \Omega \wedge \star \Omega - \Omega_{cor} \wedge \star \Omega_{cor} \right].$$ (45)

The expression $tr(\Omega \wedge \star \Omega) = \eta_{ijkl} \Omega^{ij} \Lambda \Omega^{kl}$ is in four dimensions a topological invariant called Euler’s form, which does not influence the equations of motion [12]. Hence, in 4-dimensions the Einstein-Palatini action is equivalent to

$$S_{EP} = -\frac{3}{4\Lambda \kappa} \int_D tr \left( \Omega_{cor} \wedge \star \Omega_{cor} \right).$$ (46)

We see that the Einstein-Palatini action in 4-dimensions is effectively the functional which is quadratic function of the corrected Riemannian curvature, i.e., it has a form of the action for a gauge field.

Only one difference is that in (46) we have the star operator $\star$, which is different from Hodge star operator. Namely, our star operator acts onto "interior" indices (tetrad’s indices), not onto forms as Hodge duality operator does [2, 12].

The gauge group for the theory with action (46) is the Lorentz group $L = SO(1,3)$ or its double cover $SL(2,C)$.

It is interesting that $\Omega_{cor} = 0$ for the de Sitter spacetime which is the fundamental vacuum solution to the Einstein equations

$$G_{ij}^s + \Lambda \delta_{ij}^s = 0.$$ (47)

We would like to emphasize that in the case $\Lambda = 0$ the above trick with $\Omega_{cor}$ breaks. Namely, we have in this case (see Section 3) $\Omega_{cor} = \Omega$ because $[e_i, e_k] = 0$. This result formally trivializes $S_{EP}$ action to the strange form $S_{EP} = 0$ and has no physical meaning. In the case $\Lambda < 0$ one obtains the result analogical to (46) with $\Omega_{cor} = \Omega + \frac{\Lambda}{3} \vartheta \Lambda \vartheta$ but this time $\Lambda < 0$. We did not consider this case because it needs to introduce into calculations the anti-de Sitter spacetime (and its isometry group $SO(2,3)$) which has very strange casual properties.
3 Discussion: Geometrical interpretation of the corrected curvature $\Omega_{\text{cor}}$

Let $P(M_4, GdS)$ denotes the principal bundle of de Sitter basis over a manifold $M_4$ (space-time) with de Sitter group $GdS$ [5, 13] as a structure group. This group is isomorphic to the group $SO(1, 4)$ [3, 5, 13]. Let $\tilde{\omega}$ be 1-form of connection in the principle fibre bundle $P(M_4, GdS)$. The form $\tilde{\omega}$ has values in the algebra $g$ of the group $GdS$. This algebra splits (as a vector space) into direct sum

$$ g = \text{so}(1, 3) \oplus R^{(1,3)}. \quad (48) $$

$\text{so}(3, 1)$ denotes here algebra of the group $SO(1, 3)$, which is isomorphic to Lorentz group $L$, and $R^{(1,3)}$ is a 4-dimensional vector space of generalised translations (translations in the curved de Sitter spacetime). One can identify the de Sitter spacetime with the quotient $SO(1,4)/SO(1,3)$.

Let us define $\text{so}(1, 3) =: \mathfrak{h}$, $R^{1,3} =: \mathfrak{p}$. Then we have [1,2]

$$ g = \mathfrak{h} \oplus \mathfrak{p}, \quad (49) $$

and

$$ [\mathfrak{h}, \mathfrak{h}] \subset \mathfrak{h}, \quad [\mathfrak{h}, \mathfrak{p}] \subset \mathfrak{p}, \quad [\mathfrak{p}, \mathfrak{p}] \subset \mathfrak{h}. \quad (50) $$

This means that the Lie algebra $g$ is a symmetric Lie algebra [1,2].

On the other hand, the spaces which satisfy (49)-(50) are called globally symmetric Riemannian spaces [13]. Let $P(M_4, L)$ denotes the principal bundle of Lorentz basis over the manifold $M_4$. There exists a morphism of principal bundles

$$ f : P(M_4, L) \longrightarrow P(M_4, GdS) \quad (51) $$

analogical to the morphism of the bundle linear frames and the bundle affine frames [4]. This morphism creates pull-back $f_*\tilde{\omega}$ of the form $\tilde{\omega}$ onto the bundle $P(M_4, L)$. Here $\tilde{\omega}$ is the connection 1-form in the bundle $P(M_4, GdS)$.

Let us denote this pull-back by $A$. $A$ is a 1-form on $P(M_4, L)$ with values in the direct sum [4]

$$ \text{so}(1, 3) \oplus R^{(1,3)}. \quad (52) $$

Hence, we have a natural decomposition [4]

$$ A = f_*\tilde{\omega} = \omega + \theta, \quad (53) $$

where $\omega$ is a 1-form on $P(M_4, L)$ with values in the algebra $\text{so}(1, 3)$ and $\theta$ is a 1-form on $P(M_4, L)$ with values on $R^{(1,3)}$. $\omega$ is a connection on the bundle $P(M_4, L)$.

On the base $M_4$ the 1-form $\theta$ can be identified with 1-form $\vartheta$ already used in this paper: $\theta = \vartheta$. In the following we will work on the base space $M_4$ and write (53) in the form

$$ A = \omega + \vartheta. $$
Let us compute a 2-form curvature $\tilde{\Omega}$ of the pulled back $A$. From the definition we have

$$\tilde{\Omega} = dA + \frac{1}{2} [A, A]$$

$$= d(\omega + \vartheta) + \frac{1}{2} [\omega + \vartheta, \omega + \vartheta]$$

$$= d\omega + \frac{1}{2} [\omega, \omega] + d\vartheta + \frac{1}{2} [\omega, \vartheta] + \frac{1}{2} [\vartheta, \omega] + \frac{1}{2} [\vartheta, \vartheta]. \quad (54)$$

We are going to introduce to our equations bases $\tilde{M}_{ik} = -\tilde{M}_{ki}$ of algebra so(1, 3) and $e_i$ of vector space $R^{1,3}$. In these bases, we have

$$\omega = \omega^i_k \tilde{M}_k^i = \omega^{ik} \tilde{M}_{ik}, \quad \vartheta = \vartheta^i e_i. \quad (55)$$

$(\tilde{M}_{ik}, e_i)$ form together the algebra of the de Sitter group (the basis of algebra $g$). Our elements $\tilde{M}_{ik} = -\tilde{M}_{ki}$ are real and connected with elements $M_{ik} = M_{ki}$ used in [13] in the following way

$$\tilde{M}_{ik} = \frac{i}{2} M_{ik} \Rightarrow M_{ik} = -2i\tilde{M}_{ik}. \quad (56)$$

In the terms of the elements $[\tilde{M}_{ik}, e_j]$ the computational relations for the algebra so(1, 4) = so(1, 3) $\oplus$ $R^{1,3}$ read

$$[\tilde{M}_{ij}, \tilde{M}_{kl}] = \frac{1}{2} (\eta_{il} \tilde{M}_{jk} + \eta_{jk} \tilde{M}_{il} - \eta_{ik} \tilde{M}_{jl} - \eta_{jl} \tilde{M}_{ik}) \quad (57)$$

$$[e_i, \tilde{M}_{jk}] = \frac{1}{2} (\eta_{ij} e_k - \eta_{ik} e_j) \quad (58)$$

$$[e_i, e_j] = \frac{2M_{ij}}{R^2} \quad (59)$$

The following commutation relations are important in the further considerations [5, 6, 13].

$$[\tilde{M}_{ki}, e_j] = \frac{1}{2} (\eta_{jt} e_k - \eta_{kt} e_j) \quad (60)$$

$$[e_i, e_k] = \frac{2M_{ik}}{R^2}, \quad (61)$$

where $R$ is the radius of the de Sitter spacetime. This radius $R$ is connected with $\Lambda$ by the formula $\Lambda = \frac{3}{R^2}$. Using the above equations we have

$$\tilde{\Omega} = \Omega_{\omega} + \frac{1}{2} \omega^i_k \wedge \vartheta^j \left[ \tilde{M}^k_{i,j}, e_l \right] + \frac{1}{2} \vartheta^l \wedge \omega^i_k \left[ e_l, \tilde{M}^k_{i,j} \right] + \frac{1}{2} \vartheta^l \wedge \vartheta^k \left[ e_l, e_k \right] + d\vartheta^i e_i, \quad (62)$$

where $\Omega_{\omega} = d\omega + \frac{1}{2} [\omega, \omega]$ is the curvature 2-form of the connection’s $\omega$. Taking into consideration the commutation relations in algebra $g$ given by the formulas (58) and (59),
we obtain

\[ \tilde{\Omega} = \Omega_\omega \omega + \tilde{\omega} \wedge \tilde{\vartheta} \left[ \tilde{M}_i^k, e_i \right] + \vartheta^i \wedge \vartheta^k \tilde{M}_{ik} \frac{R}{R^2} + d\vartheta^i e_i \]

\[ = \Omega^{ik}_\omega \tilde{M}_{ik} + (\omega^i_k \wedge \vartheta^k) e_i + d(\vartheta^i) e_i + \frac{\vartheta^i \wedge \vartheta^k \tilde{M}_{ik}}{R^2} \]

\[ = \Omega^{ik}_\omega \tilde{M}_{ik} + \frac{\vartheta^i \wedge \vartheta^k \tilde{M}_{ik}}{R^2} + \left( d\vartheta^i + \omega^i_k \wedge \vartheta^k \right) e_i \]

\[ = \Omega^{ik}_{\text{corr}} \tilde{M}_{ik} + \tilde{D}_\omega \vartheta^i e_i \]

(63)

\[ \Omega_{\text{cor}} := \Omega_\omega + \frac{\Lambda}{3} \vartheta \wedge \vartheta = \Omega_{\text{cor}} \]

In the Section 2 we gave the definition of the corrected curvature \( \Omega_{\text{cor}} \) as follows:

(64)

\[ \Omega_{\text{cor}} := \Omega + \frac{\Lambda}{3} \vartheta \wedge \vartheta. \]

As one can see this curvature is a curvature of the connection

(65)

\[ A := f_\omega \tilde{\omega} = \omega + \vartheta \]

if \( \Theta = 0 \), e.g., in vacuum.

If \( \Theta \neq 0 \) then \( \Omega_{\text{cor}} \) is the \( so(1,3) \)-part of the curvature \( \tilde{\Omega} \).

4 Conclusion

In this article we have shown that in four dimensions the action integral for GR with a positive cosmological constant \( \Lambda \) can be written in an analogical form to the form of the action integral for the typical gauge field. However, there is one difference - the star. Instead of the Hodge star, we have slightly different star called the duality operator [2, 12].

Our result is important because it shows that there is no need to generalize GR and construct very complicated gravitational theories to obtain a gravitational theory as a gauge theory. The ordinary GR formulated in terms of tetrads and spin connection with cosmological constant \( \Lambda > 0 \) is already a gauge theory with gauge group \( \mathcal{L} = SO(1,3) \) isomorphic to \( SL(2,\mathbb{C}) \). This fact is very interesting in connection with universality of the Einstein theory: every alternative metric theory of gravity can be reformulated as Einstein theory with additional "egzotic" matter fields [15,16]. Therefore we Conjecture.

Conjecture:

After the above reformulation one can put the pure geometric part of the action (identic with the geometric part \( S_{EP} \)) for any alternative theory with \( \Lambda > 0 \) in the form (46).
This Conjecture will be studied in future.
Some scientists [1, 2, 3] were concerned with this problem and they came to the similar conclusions as ours, but they applied in their works the Cartan’s approach to the connection in the principal bundle [2, 13, 14]. This approach is not well known among geometrists and relativists. We have used only the standard theory of connection in the principal bundle which was created by Ehresmann - Cartan’s student [4, 8]. His approach is commonly used in differential geometry and in relativity. We would like to emphasize that the formulation of the EP action in the form (46) can be important for quantizing of general relativity (because gauge fields are quantized).

Acknowledgements

One of the authors (M.D.) would like to thank J. Garecki for consultative help and constructive suggestion on matter in this article.
Appendix

\( \eta \) forms and operations with them [11]

Following [11] we define

\[
\eta_{ijkl} = \sqrt{|g|} \epsilon_{ijkl}
\]  

(A.1)

where \( \epsilon_{ijkl} \) is Levi-Civita pseudotensor with properties

\[
\epsilon_{ijkl} = \begin{cases} 
1 & \text{if the sequence of indices } ijkl \text{ is an even permutation} \\
-1 & \text{if it is an odd permutation;} \\
0 & \text{if the sequence of indices } ijkl \text{ is not an even permutation} 
\end{cases}
\]  

(A.2)

and we take \( \eta_{0123} = \sqrt{|g|} \). In Lorentzian coreper \( |g| = 1 \).

One has [11]

\[
\eta_{ijk} = \vartheta^i \wedge \eta_{jkl}
\]  

(A.3)

\[
\eta_{ij} = \frac{1}{2} \vartheta^k \wedge \eta_{ijk}
\]  

(A.4)

\[
\eta_i = \frac{1}{3} \vartheta^j \wedge \eta_{ij}
\]  

(A.5)

\[
\eta = \frac{1}{4} \vartheta^i \wedge \eta_i
\]  

(A.6)

\[
\vartheta^m \wedge \eta_{kl} = \delta^m_l \eta_k + \delta^m_k \eta_l
\]  

(A.7)

\[
\vartheta^m \wedge \eta_{kl} = \delta^m_k \eta_k - \delta^m_l \eta_l
\]  

(A.8)

\[
\vartheta^j \wedge \eta_i = \delta^j_i \eta
\]  

(A.9)

The forms \( \eta, \eta_i, \eta_{ij}, \eta_{ijkl} \) are Hodge dual to the forms \( 1, \vartheta^i, \vartheta^i \wedge \vartheta^j, \vartheta^i \wedge \vartheta^j \wedge \vartheta^k \) respectively [11].
