11

12 **Abstract:** A sustainable business model describes the rationale of how an organization creates,  
13 delivers, and captures value, in economic, social, cultural or other contexts in a sustainable way. The  
14 process of sustainable business model construction forms an innovative part of business strategy.  
15 Different industries and business types have utilized sustainability business models to satisfy their  
16 economic, environmental and social goals simultaneously. This study is conducted to present the  
17 state of the art of sustainable business models in various application areas. The business models are  
18 classified and reviewed in different application groups. To do so, a review is conducted, and the  
19 findings reveal that the application of sustainability business models can be classified in 16 unique  
20 categories. The key contribution of this study is providing an insight about the state of the art of  
21 sustainable business models in various application areas and its research path.

## 47 1. Introduction

48 Bocken and Short [1] believe that to increase the efficiency of use of resources show significantly  
 49 increase to reduce the loss of environmental and social value. Creating value for triple bottom line,  
 50 i.e. economic, society and environment is an approach that businesses take to implement sustainable  
 51 development [2]. The importance sustainability issues are globally as the economic activities of the  
 52 businesses have societal and environmental effects influencing the human being and the nature  
 53 in general.

54 Internationalization has increased worldwide competition among the firms and the  
 55 businesses are always struggling with finding the solutions to win the competition. advanced  
 56 technological developments have made the competitions much tougher as productivity and  
 57 profitability has turn into necessities. Focusing on profitability is resulted in neglecting the  
 58 possible impacts that such economic activities have on the environment and the society. New  
 59 trends, rules and strategies on reducing the harm effect of business activities on the environment  
 60 and society have imposed the firms to seek solutions facilitating them in meeting their economic  
 61 benefit and sustainability goals simultaneously. As it is depicted in figure 1, number of  
 62 publications in SBM is remarkably increased from 1999-2018. It implies that one of the serious  
 63 solutions for sustainable development is SBM and the firms have utilized SBMs to have eco-socio  
 64 friendly business activities.

65

66

**Figure 1.** Number of publications in sustainable business model from 1999-2018.

67

68

69

70

71

72

73

74

75

76

77

78

The solutions provided in the literature different for implementation of SBMs vary by the industries. The nature of the industry is very determinant in the approaches that the firms can select for their SBMs. On the other hand, that implementation of an SBM implies change, innovation or adjustment with new activities. Since sustainability deal with triple bottom line factors, addition to the financial benefit [3-5] the benefits of multiple-stakeholders such as customers, suppliers, shareholders etc. have been considered in the sustainable development. Therefore, transition toward SBMs requires to look beyond the entity of the firm and it needs innovation activities to create value for triple bottom line. Hence, Incremental changes are insufficient to encounter with sustainable development challenges [6-7]. The current study provides insights about the research path of sustainable business model (SBM). The paper, as a literature review, increase the knowledge of how different industries, sectors, research areas apply SBMs in order to achieving sustainability goals and reaching sustainable development.

79

80

81

82

83

84

85

A primary search in the literature disclosed that the number of publications in SBMs, as it is shown in figure 1, is outstandingly increasing year to year. it is diagnosed that Sustainability, Journal of Cleaner Production, Procedia CIRP, Water Resources Management, Environment Development and Sustainability are the major journals have published of the results and findings of research on SBMs. Figure 2 also clarifies that the number of documents is published in these journals are sharply increasing particularly from 2015 onward. Journals of Cleaner Production and Sustainability have had the most share of these trend as they have published the most publications in SBMs.

86

87

**Figure 2.** Number of publications in sustainability business model in different journals.

88

89

In figure 3, the data related the different subject areas have utilized SBMs in their either title, or abstract, or keywords. The pie chart in the left-side refers to the documents are published between

90 2007 to 2018 and the right-side pie chart refers to the documents published from 2015 onward.  
 91 According to figure 3, 'Business, Management and Accounting (with 17.4%)', 'Engineering (with  
 92 13.5%)', 'Environmental Science (with 12.7%)', and 'Social Science (with 11.2%)' are respectively the  
 93 subject areas have borrowed the concept of SBMs and they all together have published more than  
 94 half (i.e. 54.8%) of the documents. While during last three years, from 2016 so far, the focus of these  
 95 order of subject areas are changed and 'Environmental Science (with 18.6%)', 'Business, Management,  
 96 and Accounting (with 16.4%)', 'Social Science (with 14.4%)', and 'Engineering (with 12.3%)' are  
 97 subject areas have respectively published the most documents related to SBMs which is the  
 98 representation of a considerable shift of literature of SBMs on environmental science.

99

100 **Figure 3.** Application of sustainable business model in different subject areas.

101 A precise look at the research on the SBMs reveals that the research on SBMs is more prevalent  
 102 in the U.S than other countries. Figure 4 indicates that more than 2500 research related to SBMs are  
 103 done in the context of the U.S, from 2007 to 2018. The U.K, China, Germany, and Australia are  
 104 respectively countries in which the research is conducted on SBMs.

105

106 **Figure 4.** Research on SBMs in different countries from 2007 to 2018.

107 Among the documents published in the area of SBM 53.8% of them are original research articles,  
 108 29.6% of conference papers, 7.9% book chapter, and 3.7% of them are review articles. As figure 5  
 109 represents, original research article is the most common document is published in the area of SBM  
 110 between 2007 to 2018.

Documents by type

111

112 **Figure 5.** Types of documents are published in the area of SBM from 2007 to 2018.

113 A primary search in the literature of SBMs, it is found that 3688 documents in 27 different subject  
 114 areas are published. Table 1 constitutes the detail related to these 27 subject areas and the number of  
 115 articles has published in their area utilizing SBM in their title, or abstract or keywords.

116 **Table 1.** Application of sustainable business models in different subject areas, based on the primary  
 117 search, from 2016 to 2018.

118 In the section of materials and methods, the data collection and reviewing process has  
 119 elaborately explained. In the review section, a pic picture of the current research on SBMs, firstly,  
 120 is provided and then the application of SBMs in different areas are discussed. In the discussion  
 121 and conclusion section, the findings are articulated and application in detail and  
 122 recommendations were presented for organizations and future research.

## 123 2. Materials and Methods

124 ( TITLE-ABS-KEY ( "sustainable business model" ) AND ALL ( sustainability ) AND ALL (  
 125 "Sustainable development" ) ) AND DOCTYPE ( ar ) AND PUBYEAR > 2015

126 When we narrow our search to the "Sustainable development" and "sustainability", the number  
 127 of articles drop to 86, and the subject areas change as follow:

128  
 129 **Figure 6.** The subject areas of the articles are considered for future analysis in this study.

130 Where Environmental Science, Energy, Business, Management and Accounting, Engineering,  
 131 and Social Sciences will make our major classes of taxonomy.

## 132 3. Review

133 Sustainable business models leverage the firms to integrate their economic objectives with their  
 134 sustainability ambitions in such a way the benefits of all the stakeholders achieve simultaneously [8].  
 135 Porter and Kramer [9] argue that sustainable business models are sources of competitive advantage  
 136 in which incorporating sustainable value proposition, value creation and value capturing  
 137 mechanisms bear economic benefits to the companies. Boons and Lüdeke-Freund [10] count four  
 138 main characteristics of a sustainable business model distinguishing it from a conventional business  
 139 model. They believe that the value proposition of SBMs is an ecological or social value in accordance  
 140 with economic value. In the supply chain of SBMs suppliers feel responsibility towards the focal

141 company's stakeholders as well. The SBMs encourage the sustainable consumption. Ultimately,  
142 Boons and Lüdeke-Freund [10] express that in design of the financial model of the SBMs, addition to  
143 the economic benefits, the company's ecological and social impacts are also considered. Abdelkafi &  
144 Täuscher [11] define sustainable business models as tools incorporating sustainability in the firms'  
145 value proposition and value creation logic. Per se, SBMs not only provide value to their customer,  
146 but also to the natural environment and society. Geissdoerfer, Bocken, and Hultink [12] consider  
147 SBMs as a set of the elements in which the interrelation between these elements and their interactions  
148 with the stakeholders create, deliver, capture, and exchange sustainable value for its multi-  
149 stakeholders.

150 Businesses with different characteristics from different industries are aided by SBMs to achieve  
151 their sustainability ambitious. Besides, many researchers have incorporated this concept with the  
152 other concepts to provide possible solutions for the businesses for sustainable development. This  
153 section articulates in detail that how SBMs are applied in areas of innovation, management and  
154 marketing, entrepreneurship, energy, fashion industry, healthcare industry, agri-food, supply chain  
155 management, circular economy, developing countries, construction and engineering, hospitality  
156 industry.

### 157 3.1. Innovation

158 Much research has conducted on the common fields on innovation and sustainable business  
159 model which mainly strive to propose models, frameworks, or guidelines to elaborate how to  
160 innovate a sustainable business model or how to shift a traditional business model to a sustainable  
161 business model. Evans *et al.* [13] provide five paradigms for such transformation toward a sustainable  
162 business model.

163 Evans *et al.* [13] articulate that the firms approach to design a sustainable business model is to  
164 design sustainable value that incorporates economic, social and environmental benefits  
165 conceptualized as value forms. According to Evans *et al.* [13], the second way to design an SBM is to  
166 create a system of sustainable value flows among multiple stakeholders, including the natural  
167 environment and society as primary stakeholders. Generating a value network with a new purpose,  
168 design and governance is the third path toward an SBM. The fourth paradigm to have an SBM is to  
169 consider systemically the stakeholder interests and responsibilities for mutual value creation. Finally,  
170 internalizing externalities through Product Service System also enables innovation towards SBMs.

171 Geissdoerfer, Bocken and Hultink [14], inspired by design thinking, developed the concept of  
172 'Value Ideation' comprising value ideation, value opportunity selection, and value proposition  
173 prototyping. Based on the first principle of Evans *et al.* [13] model, the approach of Geissdoerfer *et al.*  
174 [14] to design a sustainable business model is to design a sustainable value proposition in which  
175 additional forms of value are created through identifying formerly underserved stakeholders  
176 (including society and environment) in the value proposition.

177 Likewise, "Value Triangle" is a new framework to design a sustainable business model that is  
178 proposed by Biloslavo, Bagnoli and Edgar [15]. The VT is a tool allows a firm to capture economic  
179 value from a circular value system in which the value is co-created and co-delivered through the  
180 collaboration of the firm with its stakeholders. In other words, the value generated in value triangle  
181 is able to meet the benefits of customers (customer value), partners and suppliers (partner value),

182 social actors including environment and future generation (i.e. public value), and the firm itself  
183 (captured value).

184 Oskam, Bossink, and de Man [16] propose the concept 'value shaping' for sustainability-oriented  
185 innovations that is able to clarify all the types of financial, social and environmental value that a  
186 business create by interacting with the different networks. They outline that depends on the place of  
187 the business model in the life cycle curve, different networks assist the business to design the value.  
188 Exploring value refers to the value the firm explores through the existing network and the social  
189 network of entrepreneurs. Developing value point out the firms shape their value proposition  
190 through engagement of the potential customers. Reframing value refers is the stage in which the  
191 feedbacks from the real customers are utilized to refine the delivered value. Finally, Oskam *et al.* [16]  
192 argue that redirecting value refers to shifting from the current value to other value/values due to  
193 change in mind-set of the firms; or redirecting value from the direct customers towards the end clients  
194 of the products.

195 Joyce and Paquin [17] provide a novel approach to design a sustainable business model. They  
196 propose a Triple Layered Business Model Canvas to meet the economic, social, and environmental  
197 benefits in which these three layers respectively explain how the value creation and delivering  
198 process satisfy the benefits of the business, society and the environment.

199 Roman, Liu, and Nyberg [18] propose a three-step approach to design a sustainable business  
200 model for transforming toward open access databases in which research data created from university  
201 are accessible to industry for facilitating the open innovation process. Their model comprises three  
202 stages of identifying the possible opportunities, recognizing the barriers, and finally designing the  
203 model.

204

**Table 2.** Application of Sustainable business models in the innovation.

Author/s	Year	Contribution	Methodology	Data Source

Oskam, Bossink, and de Man [16]	2018	Framework	Qualitative	Case study, interview, secondary data
Joyce and Paquin [17]	2016	Framework	Qualitative	Literature synthesis, secondary data
Roman, Liu, and Nyberg [18]	2016	Framework	Qualitative	Case study, interview

### 205 3.2. Management and Marketing

206 Business models have been considered as tools to implement the business strategies. Therefore,  
207 it makes sense that the goals of the business models should be aligned with the organizations' goals.  
208 Research has proved that designing a business model which can provide sustainability to the society,  
209 environment and the business itself requires a prerequisite: providing sustainable values to the  
210 society and the environment should be considered in the purpose of the organization, at first.

211 Stubbs [19] by studying the characteristics the sustainable business models of B Corporations  
212 illustrates that social and environmental concerns are embedded in the mission and purpose of B  
213 Corporations and the main goal of such corporations is to create positive societal impacts for its  
214 stakeholders. He realized that such thinking affected the value propositions, value creation and value

215 delivering of B corporations and the B Corps align their profit and societal impact. It is worth  
216 mentioning that businesses can be certified as B Corps that they have had the highest performance in  
217 social and environmental standards, public transparency, and legal accountability.

218 Morioka, Bolis, Evans, and Carvalho [20] conducted a multiple case studies in eleven  
219 organizations from diverse sectors, situated in Brazil and in the United Kingdom. They realized that  
220 to integrate sustainability into SBM's value creation and delivery system, the organizations should  
221 firstly, make a connection between business purpose and employees' values and believes, then they  
222 should be pro-active and clear engagement in solving sustainability problems.

223 In addition to aligning the goal of business model with the business's itself, the rule of decision  
224 makers in implementing a business model should not be neglected. Kurucz, Colbert, Lüdeke-Freund,  
225 Upward, and Willard [21] explain that how relational leadership advance the design and assessment  
226 of sustainable business models. According to Kurucz *et al.* [21] relational leadership processes that  
227 support strongly sustainable organization management help organizations to address effectively the  
228 existing constraints and also to avoid contributing to the tightening of future limits of the biosphere.  
229 They articulate that by engaging relational leadership in strongly sustainable business model canvas  
230 (ssbmc) and the future-fit business benchmark (f2b2) organizations can define and strive for their  
231 sustainability goals. Upward and Jones (2016) argue that the strongly sustainable business model  
232 canvas demonstrates relational leadership characteristics that support business modelling toward  
233 strategic sustainability. Additionally, Kurucz *et al.* [21] explain that the future-fit business benchmark  
234 (f2b2) provides a 'fourth benchmark' which defines the ultimate goal of zero negative impact on the  
235 socio-ecological system

236 A business model elucidates how a business makes money through value proposition, value  
237 creation and value delivering. The core concept in business model is "value". The value that the  
238 customer is ready to pay for it. Most of the marketing activities are dedicated in diagnosing the  
239 customers' needs so as for providing such value for them. The next stream of research on the business  
240 model sustainability, in the literature, is to engage the final users in the value proposition process. It  
241 is one of the approaches ensuring the businesses to consider their benefits and design a sustainable  
242 business model.

243 By studying firms that provide energy efficiency products and services Tolcamp, Huijben,  
244 Mourik, Verbong, and Bouwknegt [22] found that utilizing a user-centered approach to design a  
245 sustainable business model is the key to success of these firms. He realized that firms engage the  
246 customers in designing their business model in form of a four-stage loop including: design of  
247 involvement, facilitation of involvement, extraction of lessons learned and finally business model  
248 adaptation. In other words, Tolcamp *et al.* [22] claim that identifying and incorporating the customer  
249 needs into the firm's value proposition is of utmost importance in designing an effective and  
250 sustainable business models.

251 Baldassarre, Calabretta, Bocken, and Jaskiewicz [23], aided by principles user-driven innovation,  
252 provide practical framework to design a sustainable business model through designing a sustainable  
253 value proposition. User-driven innovation present solutions meeting the benefits of society and the  
254 business, at the same time through an iterative process in which potential customers are engaged in  
255 the design of value proposition.

256 De Bernardi and Tirabeni [24] perceive that designing a sustainable business model involves  
257 designing a community-centered sustainable value proposition. They by combining principles from

258 both SBM innovation and user-driven anti-consumption and well-being habits they intended to  
 259 design a sustainable business model that enhance sustainable and anti-consumption behaviours.  
 260 They studied the Italian Food Assembly, which is a successful example in Alternative Food Network  
 261 (AFN). De Bernardi and Tirabeni [24] found out two main factors have caused Italian Food Assembly  
 262 implemented a sustainable business model: 1) there is a strong knowledge sharing of sustainable  
 263 consumption behaviours among the members and 2) there is an effective distribution of best practices  
 264 among them also.

265 **Table 3.** Application of Sustainable business models in the management and marketing.

Author/s	Year	Contribution	Methodology	Data Source
Stubbs [19]	2017	Design & Process	Qualitative	Interview
Morioka et al [20]	2018	Framework	Qualitative	Case Study
Kurucz et al. [21]	2017	Conceptual model	Qualitative	Literature synthesis
Tolkamp et al. [22]	2018	Design & Process	Qualitative	Interview
Baldassarre et al. [23]	2017	Framework	Qualitative	Literature synthesis, expert interviews, and multiple workshops
De Bernardi and Tirabeni [24]	2018	Design & Process	Qualitative	Case Study, depth interviews, participant observation, focus groups and document analysis.

### 266 3.3. Entrepreneurship

267 Davies and Chambers [25] argue that the sustainable entrepreneurs encounter with hybrid  
 268 tensions when they focus on creating economic value whilst increasing social or environmental value.  
 269 They argue that conflicts among different value capturing process leads in a business instability, and  
 270 a business model innovation is the solution to eradicate the conflict. Gasbarro, Rizzi, and Frey [26]  
 271 provides empirical insights how sustainable entrepreneurs cope with regulative, normative and  
 272 cultural-cognitive issues to increase institutions' legitimacy by developing a sustainable business  
 273 model. They articulate that institutional entrepreneurs (SIEs) designing innovative business models  
 274 by engaging the final customers and strategic partnerships in developing innovative value  
 275 propositions process to, firstly, increase the benefit of innovative sustainable business models,  
 276 secondly, to imitate the possible conflicts, and ultimately to change industry norms and social beliefs  
 277 and cultural-cognitive barriers in a value proposition so as for increase legitimacy within the  
 278 normative and cultural-cognitive institutions.

279 Khalid, Hassam, and Ahmad [27] consider the entrepreneurial action theory as an alternative to  
 280 entrepreneurship theory since it has an important role in the sustainable business innovation model.  
 281 Significant knowledge derived from entrepreneurial action provides a better understanding about  
 282 how to develop and establish sustainability-innovation ventures. Whilst, Neumeyer and Santos [28]  
 283 reveal that although the networks of sustainable entrepreneurial ventures are more densely  
 284 connected in compare to conventional entrepreneurs, sustainable entrepreneurs are  
 285 underrepresented, in the Southeast United States. <sup>29</sup> also provides empirical evidences that the  
 286 investors reluctant to invest on the sustainable start-ups, particularly those are environmentally  
 287 sustainable. On the other hand, de Lange [29] also illustrate that the investors are attracted to invest  
 288 on the start-ups in the sustainable national context.

289

290

**Table 4.** Application of Sustainable business models in the entrepreneurship.

Author/s	Year	Contribution	Methodology	Data Source
Davies and Chambers [25]	2018	Theoretical and empirical evidence	Quantitative	Multiple case study, interview
Gasbarro et al. [26]	2018	Empirical evidence	Qualitative	Interviews and archive data
Khalid et al. [27]	2016	Framework	Qualitative	Literature synthesis
Neumeyer and Santos [28]	2018	Empirical evidence	Quantitative	Literature synthesis, interview, secondary data
de Lange [29]	2017	Empirical evidence	Quantitative	Secondary data

291 *3.4. Energy*

292 One of the objectives of sustainable business model is to eliminate (or at least minimize) the  
 293 harmful effect of the businesses on the environment. Many approaches are provided in the literature  
 294 for the businesses to reach this sustainable goal. Management of the resource and energy is of utmost  
 295 importance in meeting the sustainability goals. Moschetti, Brattebø, Skeie, and Lien [30] propose an  
 296 analytic process based on the execution of quantitative sustainability analyses, to transition from a  
 297 traditional focus of business models on economic value and customers toward proposing, creating,  
 298 and capturing sustainable values for the environment and the society. Sousa-Zomer and Cauchick  
 299 Miguel [31] investigate how such sustainable business model can support technological innovations  
 300 such as decentralized approaches for water quality and quantity improvements in urban areas. Their  
 301 founding revealed that having a sustainable business model through a close integration with  
 302 customers improve consumers' acceptance, risk perception, and confidence in decentralized  
 303 approaches.

304 Zhang, Guo, Gu, and Gu [32] propose a framework which assists the decision makers to develop  
 305 sustainable business models for high energy-consuming equipment (HECE). Aided by Product  
 306 Service System (PSS), they suggest a decision-making support tool for developing PSS of HECE. In  
 307 their opinion, in a sustainable business model the benefits of all the stakeholders are considered. The  
 308 illustrated that extra economic benefits impose more burdens and higher risk to the environment.  
 309 And developing PSS is not always sustainable as in gas supply service, for instance, it would lead to  
 310 extra economic and environmental burdens due to frequent transportation.

311 Rossignoli and Lionzo [33] provides empirical evidence of new forms of interdependencies  
 312 arising within partnership networks drive businesses in the energy sector to have a sustainable  
 313 business model. He believes that a network induces its contributors to expand their definition of  
 314 value and requires them to create value for both companies and society as the main objective of their  
 315 business model. According to Rossignoli and Lionzo [33], the new links among participants of a  
 316 network create new approaches for capturing value and assist them to solve the concerns related to  
 317 the resource dependency, which is achieving sustainability goals.

318 Nichifor [34] conducted a research to compare the current sustainable business models of the  
 319 current firms in the wind and solar energy sector in Romania. She finds that Both sectors have  
 320 encountered egregious changes in last two years due to the changes in supporting plans that affect  
 321 renewable energy markets and have developed them. In addition, Nichifer [34] found out these  
 322 supportive plans have attracted investors are a pessimistic outlook of future investments due to legal  
 323 instability that made them to reduce the wind projects.

324

**Table 5.** Application of Sustainable business models in the energy section.

Author/s	Year	Contribution	Methodology	Data Source
Moschetti et al. [30]	2018	Model	Quantitative	Literature synthesis and case study
Sousa-Zomer and Cauchick Miguel [31]	2018	Design & process	Qualitative	Case study
Zhang et al. [32]	2018	Framework	Qualitative	Literature synthesis and case study
Rossignoli and Lionzo [33]	2018	Empirical evidence	Qualitative	Case study, interview, questionnaire
Nichifer [34]	2015	Empirical evidence	Qualitative	Case study, interview, questionnaire

325 *3.5. Fashion*

326 Pal and Gander [35] also believe that the traditional business models in the fashion industry  
327 produce highly negative outcomes for the environment through high water usage, chemical  
328 pollutions, and incineration or landfill of a large amounts of unsold stock. Ciasullo, Cardinali, and  
329 Cosimato [36] also claim that the fashion industry is unsustainable as active companies in this  
330 industry imposed many economic, social and environmental burdens. Therefore, many tools and  
331 approach have emerged to design a sustainable business model for coping with these social and  
332 environmental issues in the fashion industry. Kozlowski, Searcy, and Bardecki [37], for instance,  
333 develop a new design tool, called the reDesign canvas, to assist sustainable designers in the fashion  
334 industry. They propose a business model canvas with 12 building blocks ensuring the entrepreneurs  
335 to build a sustainable fashion brand. Hirscher, Niinimäki, and Joyner Armstrong [38] aiding by social  
336 manufacturing theory strived to design a more sustainable innovative value in design and  
337 manufacturing of fashion. They use do-it-yourself (DIY), do-it-together (DIT) design strategies in  
338 which users turned into the value creators to develop a sustainable business model.

339 Slow fashion is an approach aimed at intensifying sustainability in the fashion industry. Jung  
340 and Jin [39] conducted a research to investigate the profitability this approach in the fashion industry.  
341 Customer value creation framework, which is one of the slow fashion solutions, refers to creating  
342 perceived customer value. The provide empirical evidence that participating the customers in the  
343 value creation process increases their intention to pay a price premium for slow fashion products.  
344 Jung and Jin [39] found out delivering creating customer value for slow fashion positively affects  
345 consumers' purchase intentions which can secure an economically sustainable business model, while  
346 it continuously ameliorating environmental and social sustainability.

347 Pal and Gander [35] argue that incongruence of fashion customers' value with the value  
348 propositions and the barriers in transition of supply chain toward a slowing and a closing loop of  
349 resources are detrimental to developing a sustainable business model in the fashion industry. <sup>35</sup>  
350 believe that development of a business model should be considered as a system for creating value for  
351 the customer and environmental and capturing value for the firm so that the firms can replace the  
352 dominant, unsustainable model with sustainable business models in fashion industry.

353

354

**Table 6.** Application of Sustainable business models in the fashion industry.

355 *3.6. Healthcare Industry*

356 Nikou and Bouwman [40] conduct a systematic literature review based on a business model  
357 ontology to find the applications of mobile technology and devices in the healthcare industry. Their  
358 findings illustrate that in order for Mobile Technology contribute to the design of sustainable business  
359 models in the healthcare industry, non-technological business model components such as value  
360 proposition, organizing and revenue models should be considered rather than focusing on the service  
361 platforms. In other words, to design a sustainable business model in the healthcare industry by  
362 utilizing Mobile Technology, value propositions should be designed based on the customers values  
363 to provide social benefits and the value capture processes should be designed to provide economic  
364 benefits. Merchant, Ward, and Mueller [41] claim that utilizing Telemedicine (also known as  
365 telehealth) is a tool that provide sustainability to the hospitals. According to Merchant, Ward, and  
366 Mueller [41], Telemedicine provides solutions to design value propositions to develop a sustainable  
367 business model. Their results disclose that, although, hub hospitals are more responsible for the  
368 design of sustainable business models in compare to the spoke hospitals in the U.S., both hub and  
369 spoke hospitals pointed out that telemedicine helps them to meet their mission, facilitates access,  
370 keeps lower-acuity patients closer to home, and helps head off competition. However, Anwar and  
371 Prasad [42] argue that although telemedicine has presented many solutions for developing a  
372 sustainable business models in the healthcare industry, adoption to such technology has turned into  
373 the utmost importance. Because evolution and sometimes revolution in this technology has made it  
374 hard to the users to get used to it. Anwar and Prasad [42] recommend a continuous eHealth literacy  
375 so as for, firstly, facilitating the transition era and secondly, the development of new business models  
376 in which the users' involvement and motivation and also the revenue generation have been  
377 considered. They express that the telemedicine services should be user- friendly and sustainable  
378 which are able to integrate all stakeholders' benefits in one system.

379 **Table 7.** Application of Sustainable business models in the healthcare industry.

Author/s	Year	Contribution	Methodology	Data Source
Nikou and Bouwman [40]	2017	Theoretical evidence	Qualitative	Literature synthesis
Merchant, Ward, and Mueller [41]	2015	Theoretical & empirical evidence	Qualitative	Literature synthesis, secondary data, and interviews
Anwar and Prasad [42]	2018	Framework	Quantitative	Literature synthesis

380 *3.7. Agri-food*

381 Research interest in providing sustainable solutions for developing business models in the agri-  
382 food sector has increased in these years [43]. Franceschelli, Santoro, and Candelo [44] argue that

383 development of sustainable business model innovation within the food industry, especially for start-  
 384 ups, is of utmost importance, because the industry is itself linked with nature and human respect.  
 385 Barth, Ulvenblad, and Ulvenblad [43] by conducting a systematic literature review, proposes a  
 386 conceptual framework for sustainable business model innovation in the agri-food sector which can  
 387 meet the challenges encountered in taking a sustainability perspective.

388 Franceschelli *et al.* [44] contribute to the extant research by introducing the concept of sustainable  
 389 innovation within the business model literature. They utilize business model canvas to design an  
 390 innovative sustainable business model for food start-ups. Franceschelli *et al.* [44] propose a  
 391 sustainable business model based on business model canvas by providing sustainable solutions for  
 392 each component of the business model.

393 Lee and Slocum [45] study the meeting organizers who plans the meetings food and beverage  
 394 providers. They provide empirical evidences that such meeting organizers have selected to have a  
 395 sustainable business model by organizing the meetings for the local foods. Although they have a  
 396 contractual flexibility to select foods, there is a willingness to pay a price-premium for local products.  
 397 Lee and Slocum [45] also show that the meeting/event attendees have not considered themselves  
 398 sustainable yet and there is a need to increase the knowledge of and the benefit of local foods (which  
 399 are organic and harmless for the environment) to enhance the attendees' knowledge about  
 400 sustainability.

401 Robinson, Cloutier, and Eakin [46] prove that the landscaping enterprises have a sustainable  
 402 business model, thereby provide multifunctional edible landscapes in the cities, have a greater range  
 403 of value propositions and revenue streams resulting in increasing their competitive advantage. They  
 404 express that these enterprises can have the potential value creation of edible landscaping ranged  
 405 between \$3.9 and \$66 billion, and that positive return on investment (ROI) could be achieved within  
 406 one to five years.

407 **Table 8.** Application of Sustainable business models in the agri-food section.

### 408 3.8. Supply Chain Management

409 Supply chain management is another sector has borrowed the concept of sustainability business  
 410 model as a possible solution to meet sustainable development. The objective of sustainability is to  
 411 address environmental and socio-economic issues in the long term [47]. Ray and Mondal [48] provide  
 412 evidences illustrate that collaboration is better than competition to sustain in the market. They argue  
 413 that collaboration among firms within a closed-loop supply chain (CLSC) leads in sustainable  
 414 business model in which the benefits of three bottom line concepts, i.e. protect environment, improve  
 415 economic performance, and social performance, can be met. Therefore, Ray and Mondal [48] propose  
 416 a collaborative business model and mechanism for collaborative business strategies in a CLSC. Witjes  
 417 and Lozano [47] also proved evidences classifying that collaboration is crucial to develop sustainable

418 business models for supply chain management. They believe that collaboration between procurers  
 419 and suppliers in the procurement process mitigate the use of raw material and waste generation  
 420 through the development of sustainable business models. Witjes and Lozano [47] declare in a  
 421 collaboration business model, suppliers and procurers gain experiences in the collaboration process  
 422 to improving circular economy objectives contribution and to secure economic benefits for both  
 423 parties, at the same time.

424 Geissdoerfer, Morioka, de Carvalho, and Evans [49] inspired by circular business model concept  
 425 and circular supply chain management concepts strive to design a sustainable framework to provide  
 426 solutions for sustainable supply chain management. They disclose that circular business model  
 427 provides different solution for different loops: closing loops, slowing loops, intensifying loops,  
 428 narrowing loops, and dematerializing loops.

429 Brennan and Tennant [50] conducted a comparative case study to find out how to resolve trade-  
 430 offs in sustainable supply chain management. They realized that for transition from a traditional  
 431 supply network toward sustainable supply network, business model innovation requires to create  
 432 sustainable values and resolve trade-offs. They illustrate how network-centric business model  
 433 innovation provides sustainable solutions for the trade-off between economic and environmental  
 434 benefit through the prioritization of sustainability-related 'cultural' resources.

435 **Table 9.** Application of Sustainable business models in the supply chain management.

Brennan and Tennant [50]	2018	Empirical Evidences	Qualitative	Case study and Interview

### 436 3.9. Circular Economy

437 Circular economy in the literature, has widely considered as a tool to implement and design a  
 438 sustainable business model in the different sectors in response to current unsustainable trajectories.  
 439 As it is shown in the table 9, Witjes and Lozano [47] and Geissdoerfer *et al.* [49] utilized this concept  
 440 to design a sustainable business model for the area of supply chain management. In this section, will  
 441 the other articles that have benefited from the Circular Economy for designing a sustainable business  
 442 model are compiled and submitted.

443 Heyes, Sharmina, Mendoza, Gallego-Schmid, and Azapagic [51] applied the Backcasting and  
 444 Eco-design for the Circular Economy (BECE) framework to identify how ICT firms diagnose circular  
 445 business model innovations. BECE is designed for the product-oriented firms that is why Heyes *et al.*  
 446 [51], by shifting the focus to a user-centered eco-design, design a circular economy models consistent  
 447 with the company's priorities of customer satisfaction and profitability.

448 Todeschini, Cortimiglia, Callegaro-de-Menezes, and Ghezzi [52] by synthesizing of the current  
 449 literature have developed an innovative circular business model in which the value propositions are  
 450 sustainable and reduce environmental impacts. By conducting eight case studies on innovative  
 451 fashion startups, they identify the concept of 'born sustainable' which assist the entrepreneurs to  
 452 design sustainable value propositions to accomplish the circular economy objectives.

453 However, Stål and Corvellec [53] provide empirical evidence, based on seven case studies in  
 454 Sweden, that businesses pro-actively looking for increase institutional demands for circularity to  
 455 meet their own economic interests while that companies buffer their business model and their value  
 456 proposition from emerging demands.

457 **Table 10.** Application of Sustainable business models in the circular economy.

Todeschini <i>et al.</i> [52]	2017	Framework	Qualitative	Literature synthesis, case study, interviews
Stål and Corvellec [53]	2018	Empirical Evidences	Qualitative	Literature synthesis, case study, interview

### 458 3.10. Developing Countries

459 Research conducted on sustainable business models in develop countries mainly address bottom  
 460 of the pyramid (BOP) context, where there are paucity of resources and population suffer from  
 461 poverty. Bottom of pyramid refers to the global poor who are in extreme poverty and are unable to  
 462 meet basic needs [54], most of whom live in the developing countries. According to the World Bank  
 463 reports, 2.7 billion, which are around half the global population, have less than \$2 a day income [54].  
 464 In the literature, sustainable business models (SBMs) are consider as tools to create values for both  
 465 business and society. Designing a market-oriented business model has been widely recommended  
 466 for providing win-win solutions for multiple stakeholders.

467 Bittencourt Marconatto, Barin-Cruz, Pozzebon, and Poitras [55] provide evidences illustrating  
 468 the Brazilian government facilitates transition toward sustainable business model by providing  
 469 strategic and shared value opportunities. By study the Ecoelce project, they articulate how to design  
 470 an SBM in the BOP context of Northeastern Brazil. Dembek, York, and Singh [56] provide nine  
 471 individual business models addressing poverty through studying 55 organizations in Indonesia and  
 472 the Philippines. They create a BoP business model matrix to elaborate how the identified business  
 473 models create, offer, and capture value to benefit different stakeholders. Goyal, Sergi, and Kapoor  
 474 [57] provide strategic solution for the social enterprises to develop a sustainable business model  
 475 which can meet the underserved needs of the BoP segment in India. They propose a practical  
 476 framework for creating a sustainable, scalable and socially relevant ecosystem. Palomares-Aguirre,  
 477 Barnett, Layrisse, and Husted [58] study business models of three firms that provide affordable  
 478 housing for very poor people in Mexico. Their finding reveals that community engagement and  
 479 government collaboration are very important in creating and delivering a sustainable value so as to  
 480 better serve the BoP.

481 **Table 11.** Application of Sustainable business models in the developing countries.

Palomares-Aguirre <i>et al.</i> [58]	2018	Empirical Evidences	Qualitative	Literature synthesis, case study, interview

483 3.11. *Construction and Engineering*

484 Construction, the biggest industry in the developed world, has greatest environmental impact  
 485 [59] as well as economic and social consequences [30]. However, Selberherr [60] claim that sustainable  
 486 buildings bear many potential benefits for service providers and the society. Selberherr [60] proposes  
 487 strategies for the players in the construction sector to proactively contribute to sustainable  
 488 development of the society. She recommends that to design a sustainable business model which is  
 489 aimed at cooperatively optimizing buildings and infrastructures and taking the responsibility for the  
 490 operating phase via guarantees.

491 Wasiluk [61] provide empirical evidences that businesses in lieu of from justifying the business  
 492 case for sustainability they should concentrate on understanding how to mobilize their intellectual  
 493 capital to enhance an ecological sustainable and socially equitable enterprise. Indeed, she considers  
 494 the intellectual capital as a mediator sophisticating sustainable value proposition for the Australian  
 495 property and construction sector.

496 Boo, Dallamaggiore, Dunphy, and Morrissey [59] argue that there are approximately 190 million  
 497 buildings in Europe which were built before energy efficiency was a common issue in construction.  
 498 They consider innovative business models (IBM) as a solution to provide sustainability in the energy  
 499 efficient building market. Boo, Dallamaggiore, Dunphy, and Morrissey [59] propose sustainable  
 500 business models ensuring long- lasting change in the energy efficient building market. They believe  
 501 that the co-evolution of business models with both the wider energy system and the natural  
 502 environment is crucial for the development of a sustainable business model.

503 **Table 12.** Application of Sustainable business models in the construction and engineering.

Author/s	Year	Contribution	Methodology	Data Source
Selberherr [60]	2015	Theoretical Evidences	Qualitative	Literature synthesis
Wasiluk [61]	2013	Empirical Evidences	Qualitative	Case study, interview
Boo <i>et al.</i> [59]	2016	Framework	Qualitative	Literature synthesis

504 3.12. *Hospitality Industry*

505 Hotels are counted one the most important sectors of hospitality industry which have affected  
 506 by sustainability movement. The research is done in the common field of business model  
 507 sustainability and hotels are still in the infancy stage. Qua most of the studies have tried to investigate  
 508 the sustainability level of the hotels rather than providing solutions for development of a sustainable  
 509 business model.

510 Buffa, Franch, and Rizio [62], utilizing a quantitative approach, provide empirical evidences that  
 511 medium-sized hotel enterprises (SMHEs) in Trentino, a traditional tourist destination in the Italian  
 512 Alpine Arc, apply sustainable business models. They argue that these SMHEs adopted three different  
 513 sets of environmental management practices (EMPs) to accomplish their sustainability goals of their  
 514 business models.

515 Høgevold, Svensson, Padin, and Dos Santos [63] compare the different between sustainable  
 516 business models in manufacturing companies and hotels as a service sector. They believe that the  
 517 nature of the industries is very effective in the models they have selected to meet the sustainability  
 518 objectives. Tangibility and intangibility of the products and services influence the assessmentability  
 519 of the social and environmental impact of their economic activities.

520 Results of the research of Melissen, Cavagnaro, Damen, and Düweke [64] disclose that the  
 521 current business models of hotel industry are not able to meet the sustainability objectives, especially  
 522 with respect to addressing guests' needs and wants and (subsequent) institutionalization of  
 523 sustainability. Nonetheless, they argue that managers' willingness and capabilities are potentially the  
 524 sources stimulating them to transit toward a sustainable business model.

525 Høgevold and Svensson [65] develop a sustainable business model for the hotels based on a case  
 526 study they have conducted among a major Scandinavian hotel chain known for having implemented  
 527 sustainable business practices within the company and in its business network. They are the only  
 528 study that have provided sustainable solutions for different element of business model in which the  
 529 benefits of multi-stakeholders have considered in value creating and capturing processes.

530 **Table 13.** Application of Sustainable business models in the hospitality industry.

#### 531 4. Discussion

532 This study provides a comprehensive review on the applications of SBMs in different industries,  
 533 sectors, and research area. Energy, fashion, healthcare, food, construction and hospitality are  
 534 industries have resorted to the principles of SBMs for realization of sustainable development.  
 535 Entrepreneurship, management and marketing, innovation, circular economy, and supply chain  
 536 management are research areas have utilized SBMs to provide solutions to achieve their  
 537 sustainability ambitious. Application of SBMs in the developing countries is another category has  
 538 emerged in the initial screening phase of the literature.

539 Finding reveals that circular business models, base of the pyramid, product service systems, are  
 540 the major strategies have considered in the literature to design sustainable business models that is  
 541 quite consistent with the findings of Bocken *et al.* [3]. Many authors consider designing a sustainable  
 542 value proposition as an approach to design a sustainable business model. In this regard, Geissdoerfer  
 543 *et al.* [14], Biloslavo *et al.* [15], Oskam *et al.* [16], Tolkamp *et al.* [22], Baldassarre *et al.* [23], De Bernardi  
 544 and Tirabeni [24], and Hirscher *et al.* [38] have presented innovative approaches in which customers  
 545 are engaged in the designing process to devise a sustainable value proposition. Hirscher *et al.* [38],  
 546 for instance, utilize do-it-yourself (DIY) and do-it-together (DIT) design strategies to design a more  
 547 sustainable innovative value proposition. Geissdoerfer *et al.* [14], inspired by design thinking,  
 548 developed the concept of value ideation to design a sustainable value proposition comprising  
 549 additional values all stakeholders (including society and environment) in the value proposition.  
 550 Oskam *et al.* [16] propose the concept value shaping to develop financial, social and environmental  
 551 value that a business create by interacting with the different networks.

552 Studying the role of managers in designing SBMs is a topic has considered in the common area  
553 of literature of business and management and business model sustainability. Kurucz *et al.* [21] debate  
554 that relational leadership processes that support strongly sustainable organization management help  
555 organizations to meet their sustainability ambitious. On the other hand, Stubbs [19] believe that those  
556 organizations have embedded the social and environmental concerns in their mission and their  
557 purpose have been successful in achieving their SBM goals.

558 The main issue emerged in the application of SBMs in entrepreneurship is that despite there is  
559 a remarkable demand on the sustainable businesses, sustainable entrepreneurs are underrepresented  
560 [29] and the investors reluctant to invest on the sustainable start-ups, particularly those are  
561 environmentally sustainable [29]. Whilst, Davies and Chambers [25] and Gasbarro *et al.* [26] consider  
562 business model sustainability innovation as the solution to conquer the barriers to implementing an  
563 SBM.

564 Much research is conducted on developing solutions for SBMs to manage the resource and the  
565 energy as Moschetti *et al.* [30], Sousa-Zomer and Cauchick Miguel [31], and Zhang *et al.* [32] propose  
566 frameworks and approaches to develop SBMs provide values to the energy resources. Rossignoli and  
567 Lionzo [33] also recommend partnership networks is a solution that assisting businesses in the energy  
568 to provide sustainable value propositions.

569 Pal and Gander [35] also believe that the traditional business models in the fashion industry  
570 produce highly negative outcomes for the environment through high water usage, chemical  
571 pollutions, and incineration or landfill of a large amounts of unsold stock. Therefore, sustainable  
572 business models are considered as a solution to minimize such negative effects. The most prevalent  
573 approach in designing a SBM in the fashion industry is to participating the customers in the value  
574 creation process [38,39]. On the other hand, Pal and Gander [35] believe that creating value for the  
575 customer and environmental and capturing value for the firm is the solution to eliminate the barriers  
576 in transition of traditional supply chain toward a slowing and a closing loop of resources and toward  
577 a sustainable business model in the fashion industry.

578 The healthcare is another industry utilizes SBMs to achieve sustainability goals. Surprisingly  
579 enough, the found articles have used SBMs to address sustainability issues have aided digital  
580 technologies. In other words, the common literature of business model sustainability and healthcare  
581 are tied with digital technology. As Merchant *et al.* [41] and Anwar and Prasad [42] consider  
582 Telemedicine as a solution to design value propositions to develop a sustainable business model in  
583 healthcare industry. In addition, Nikou and Bouwman [40] believe that utilizing the mobile  
584 technology can design a sustainable business model in the healthcare industry.

585 The supply chain sector is the other sector that is found in the literature which has utilized the  
586 principles of the SBM to provide solutions to reach the sustainability development [47]. Ray &  
587 Mondal [48], Geissdoerfer *et al.* [49], and Brennan and Tennant [50] argue that collaboration and  
588 networks among firms within a closed-loop supply chain (CLSC) leads in sustainable business model  
589 in providing benefits to three bottom line concepts of protect environment, improve economic  
590 performance, and social performance. Since it the supply chain concept implies B2B relationships  
591 between the suppliers and buyer, such networks and collaboration can resulted in quarantinable  
592 consumption and according to Witjes and Lozano [47] it reduces the use of raw material and waste  
593 generation also. Finding exposes that the Bottom of pyramid has centered in the hotspot of designing  
594 SBMs in in develop countries. It is found that SBMs offer solutions such as designing a market-

595 oriented business model to provide win-win solutions for multiple stakeholders. The research in the  
596 common field of business model sustainability and hotels, as the most important sectors of hospitality  
597 industry, are still in the infancy stage as most of the studies have tried to investigate the sustainability  
598 level of the hotels rather than providing solutions for development of a sustainable business model.

599 Illustrating the research path and articulating in detail the application of SBMs in different  
600 industries, sectors, and research area are the contributions of this study that provide insights and the  
601 possibility of compressions for both practitioners and researchers who are eager to find sustainable  
602 solutions through SBMs. Different approach has revealed and to design an SBM and the most come  
603 one was designing a sustainable value proposition which is able to provide values to multi-  
604 stakeholders such as society and environment while it can be profitable for the organization.  
605 Sustainable value creation and value delivering plus B2B partnerships are other solutions have  
606 emerged in the literature for developing an SBM.

## 607 5. Conclusions

608 The process of sustainable business model construction forms an innovative part of business  
609 strategy. Different industries and business types have utilized sustainability business models to  
610 satisfy their economic, environmental and social goals simultaneously. This study is conducted to  
611 present the state of the art of sustainable business models in various application areas. The business  
612 models are classified and reviewed in different application groups. To do so, a review is conducted,  
613 and the findings reveal that the application of sustainability business models can be classified in 16  
614 unique categories. The key contribution of this study is providing an insight about the state of the art  
615 of sustainable business models in various application areas and its research path. It is found that  
616 SBMs offer solutions such as designing a market-oriented business model to provide win-win  
617 solutions for multiple stakeholders. The research in the common field of business model  
618 sustainability and hotels, as the most important sectors of hospitality industry, are still in the infancy  
619 stage as most of the studies have tried to investigate the sustainability level of the hotels rather than  
620 providing solutions for development of a sustainable business model.

621 Illustrating the research path and articulating in detail the application of SBMs in different  
622 industries, sectors, and research area are the contributions of this study that provide insights and the  
623 possibility of compressions for both practitioners and researchers who are eager to find sustainable  
624 solutions through SBMs. Different approach has revealed and to design an SBM and the most come  
625 one was designing a sustainable value proposition which is able to provide values to multi-  
626 stakeholders such as society and environment while it can be profitable for the organization.  
627 Sustainable value creation and value delivering plus B2B partnerships are other solutions have  
628 emerged in the literature for developing an SBM.
