15

16 **Abstract:** During the past two decades of the e-commerce growth the concept of business model has  
17 become increasingly popular. More recently, the research on this realm has grown rapidly with a  
18 diverse research activity covering a wide range of application areas. Considering the sustainable  
19 development goals the innovative business models have brought competitive advantage to improve  
20 the sustainability performance of organizations. The concept of sustainable business model  
21 describes the rationale of how an organization creates, delivers, and captures value, in economic,  
22 social, cultural or other contexts in a sustainable way. The process of sustainable business model  
23 construction forms an innovative part of business strategy. Different industries and businesses have  
24 utilized sustainable business models concept to satisfy their economic, environmental and social  
25 goals simultaneously. However, the success, popularity, and the progress of sustainable business  
26 models in different application domains are not clear. To explore this issue, this research provides  
27 a comprehensive review on sustainable business models literature in various application areas.  
28 Notable sustainable business models are identified and further classified in fifteen unique  
29 categories, and in every category the progress (either failure or success) has been reviewed and the  
30 research gaps are discussed. Taxonomy of the applications includes, innovation, management and  
31 marketing, entrepreneurship, energy, fashion, healthcare, agri-food, supply chain management,  
32 circular economy, developing countries, engineering, construction and real estate, mobility and  
33 transportation, and hospitality. The key contribution of this study is to provide an insight about the  
34 state of the art of sustainable business models in various application areas and the future research  
35 directions. This paper concludes that popularity and the success rate of sustainable business models  
36 in all application domains have been increased along with increasing use of advanced ICT  
37 technologies.

38 **Keywords:** sustainable business model; sustainable development; sustainability; business model;

40

41

## 42 1. Introduction

43 The business model concept is an abstract representation of the value flow and the interactions  
44 between value elements of an organizational unit. The essential value elements of organizations  
45 concern with proposition, creation, delivering, and capturing the value. A simplified way of  
46 communicating the connection and function of these elements is vital in the success of any business  
47 [1]. For this purpose, the concept of business model has originated to better present the complex  
48 business ideas more efficiently. Through a business model the business workflow is communicated  
49 to investors in detailed within a short time frame [2]. In fact, the effective representation of planning,  
50 analysis, communication, and implementation of organizational complex units' performance are  
51 reported as one of the major reason behind the popularity of business models [3]. Geissdoerfer et al.  
52 [4] presents a detailed review on the different types and various definitions of business models where  
53 a vast number of definitions are presented. Model of an organizational system [5], a simplified  
54 characteristic of business concept [6], and a reduced scope of business [7] are suggested as the  
55 various types of the business models. For decades the vital sustainability issues with their major  
56 societal and environmental effects influencing the human being and the nature had not been the  
57 priorities of most business model types. Nevertheless, business models, for achieving the  
58 sustainability goals of the companies have finally become under pressure to transform into a more  
59 sustainable economic system.

60 Internationalization along with the urge to keep up with the sustainable development goals  
61 had made the worldwide competition among the firms complex, and the conventional business  
62 models had been struggling with finding the promising solutions to win the competitions. In this  
63 context, the alternative concept of sustainable business model has brought competitive advantage  
64 to the organizations through empowering the conventional business models meeting the  
65 sustainable development goals while maintaining productivity and profitability [8, 9]. Thus,  
66 creating value for triple bottom line, i.e. economic, society and environment has been the ultimate  
67 goal of sustainable business models [10]. Sustainable business models have the great potential to  
68 incorporate the principles of sustainability and integrate sustainability goals into the value  
69 proposition, value creation, and value capture activities of businesses [11]. Sustainable business  
70 models aim at employing proactive multi-stakeholder management, innovation, and long-term  
71 perspective to meet the sustainability goals. Sustainable business models, therefore, have been  
72 effectively contributing in reducing the harmful effects of business activities on the environment  
73 and society through providing solutions to the firms to help them meeting their economic and  
74 sustainability goals simultaneously [12]. Thus, the concept of sustainable business model has  
75 emerged to provide a platform for integrating sustainability considerations [13]. From this  
76 perspective circular business models [14] share similarity with sustainable business models.  
77 However they include additional characteristics which are mainly concerned with slowing,  
78 intensifying, and narrowing resource loops [4].

79 The review paper of Evans et al. [15] shows how sustainable business models have helped  
80 businesses to achieve their sustainability ambitions. Further research, e.g. Boons et al. [11],  
81 Geissdoerfer et al. [4] and Schaltegger et al. [9] provide a collection of the definitions to the concept  
82 of sustainable business model. Although, there exists literature on the definitions and overview of  
83 the concept of the sustainable business model, there is a research gap in the progress and evaluation  
84 of the performance of sustainable business models in each specific application domains. The

85 widespread and effectiveness of the sustainable business models in business domains has not been  
86 identified. Furthermore, the applicability, popularity, success, and the future trends in various  
87 business domains have not been not discussed yet. Consequently, the contribution of this article is to  
88 present a classification of the widespread applications of sustainable business models in addition to  
89 an in-depth investigation on various applications domains considering the success and failure cases.

90 The rest of this paper is structured as follow. Section two presents the methodology of the  
91 review. Section three presents the taxonomy of the research and the review's initial report. Further,  
92 the in the fourteen subchapters the applications of s in the individual categories presented. Section  
93 four and five present the discussion and conclusions of the research, respectively where paper  
94 concludes with a short discussion of the findings and some final remarks.

95

## 96 2. Method

97 The primary goal of this survey is to present the state of the art of s in the individual  
98 application areas. Accordingly, the research methodology has been developed to identify, classify  
99 and review the notable peer-reviewed articles in design and implementation of sustainable  
100 business models in top-level subject fields. Through the search query of "business model\*" and  
101 "sustainab\*" for title, abstract and keywords the relevant literatures are identified. The query of  
102 (TITLE-ABS-KEY ("business model\*") AND TITLE-ABS-KEY (sustainab\*)) would result in 3,494  
103 document results. However, through axillary search keywords such as "sustainable development" in  
104 all fields of the paper we make sure that the most relevant papers are identified and the paper  
105 significantly contribute to the definition of sustainable development. Consequently, the alternative  
106 search query of (TITLE-ABS-KEY ("business model\*") AND TITLE-ABS-KEY (sustainab\*) AND ALL  
107 ("sustainable development")) would result in 1,584 document results which forms our initial  
108 database. Using the Thomson Reuters Web-of-Science and Elsevier Scopus for implementation of the  
109 search queries would assure that any paper in data base would meet the four types of quality  
110 measure, i.e., source normalized impact per paper (SNIP), CiteScore, SCImago journal rank (SJR), and  
111 h-index.

112 The research methodology follows a comprehensive and structured workflow based on a  
113 systematic database search and cross-reference snowballing. The flowchart of the research  
114 methodology is presented in figure 3. The method is considered as a modified version of review  
115 proposed by Easterby-Smith et al. (2015).

116 In the first step the search queries explore the Thomson Reuters Web-of-Science and Elsevier  
117 Scopus databases. In the second step the abstract and keywords of the identified articles are  
118 browsed to identify the relevant literature, and exclude the irrelevant ones. In step three the  
119 database of the relevant articles is created. In step four, the article is carefully read and the  
120 category of the application is identified accordingly. In this step the expert based knowledge and  
121 the initial preferences would influence the number and the type of the categories. In step five we  
122 decide on generating a new category and export the article in a new table of application domain  
123 or pass the article to the step six where a category would host an article in its table. Once a category  
124 created for a new article, in the step seven, we pass that article to that category. In the step eight  
125 we save the content of our database in various categories, update the content of the tables, and  
126 review the papers. This workflow will be repeated until sorting out all the papers.

### 136 3. Review

137 Studying the initial database communicates interesting information. As it is depicted in  
 138 figure 4, the number of publications in sustainable business model is remarkably increased during  
 139 the past two decades. It implies that one of the major solutions for sustainable development is  
 140 sustainable business model and the firms have utilized sustainable business models to have eco-  
 141 socio friendly business activities.

142 Furthermore, the nature of a particular business is very determinant in the approaches that  
 143 the firms can select for their sustainable business models. In fact, the solutions provided in the  
 144 literature present different characteristics for implementation of sustainable business models  
 145 according to the business domain. On the other hand, that implementation of a sustainable  
 146 business model implies new challenges, innovation or adjustment with new activities. Since  
 147 sustainability deal with triple bottom line factors, addition to the financial benefit [14, 16, 17] the  
 148 benefits of multiple-stakeholders such as customers, suppliers, shareholders etc. have been  
 149 considered in the sustainable development. Therefore, transition toward sustainable business  
 150 models requires to look beyond the entity of the firm and it needs innovation activities to create  
 151 value for triple bottom line. Hence, Incremental changes are insufficient to encounter with sustainable  
 152 development challenges [18, 19]. The current study provides insights about the research path of  
 153 sustainable business model. The paper, as a literature review, increase the knowledge of how  
 154 different industries, sectors, research areas apply sustainable business models in order to  
 155 achieving sustainability goals and reaching sustainable development.

The initial database of literature disclosed that the number of publications on sustainable business models, as it is also shown in figure 3, has been increasing year by year. It is diagnosed that the journal of Sustainability, Journal of Cleaner Production, Procedia CIRP, Water Resources Management, Environment Development and Sustainability are the major journals whom have published the results and findings of research on sustainable business models. Figure 3 also clarifies that the number of documents is published in these journals are increasing particularly from 2014 onward. Journals of Cleaner Production and Sustainability have had the most share of these trend as they have published the most publications in sustainable business models.

177

In figure 3, the data related the different subject areas have utilized sustainable business models in their either title, or abstract, or keywords. The pie chart in the left-side refers to the documents are published from 2007 to 2018 and the right-side pie chart refers to the documents published from 2015 onward. According to figure 3, 'Business, Management and Accounting (with 17.4%)', 'Engineering (with 13.5%)', 'Environmental Science (with 12.7%)', and 'Social Science (with 11.2%)' are respectively the subject areas have borrowed the concept of sustainable business models and they all together have published more than half (i.e. 54.8%) of the documents. While during last three years, from 2016 so far, the focus of these order of subject areas are changed and 'Environmental Science (with 18.6%)',

178 'Business, Management, and Accounting (with 16.4%)', 'Social Science (with 14.4%)', and  
 179 'Engineering (with 12.3%)' are subject areas have respectively published the most documents related  
 180 to sustainable business models which is the representation of a considerable shift of literature of  
 181 sustainable business models on environmental science.

182

183 **Figure 4.** Application of sustainable busiess model in different subject areas.

184 A precise look at the research on the sustainable business models reveals that the research on  
 185 sustainable business models is more prevalent in the U.S than other countries. Figure 4 indicates that  
 186 more than 2500 research related to sustainable business models are dome in the context of the U.S,  
 187 from 2007 to 2018. The U.K, China, Germany, and Australia are respectively countries in which the  
 188 research is conducted on sustainable business models.

189

190 **Figure 5.** Research on sustainable business models in different countries from 2007 to 2018.

191 Among the documents published in the area of sustainable business model 53.8% of them are  
 192 original research articles, 29.6% of conference papers, 7.9% book chapter, and 3.7% of them are review  
 193 articles. As figure 5 represents, original research article is the most common document is published  
 194 in the area of sustainable business model from 2007 to 2018.

Documents by type

Where Environmental Science, Energy, Business, Management and Accounting, Engineering, and Social Sciences contribute more in number of documents. Nevertheless, the research methodology classifies the literatures into fourteen categories i.e. innovation, management and marketing, entrepreneurship, energy, fashion, healthcare, agri-food, supply chain management, circular economy, developing countries, engineering, construction and real estate, mobility and transportation, and hospitality. Figure 8 illustrates this classification.

Sustainable business models leverage the firms to integrate their economic objectives with their sustainability ambitions in such a way the benefits of all the stakeholders achieve simultaneously [20]. Porter and Kramer [21] argue that sustainable business models are sources of competitive advantage in which incorporating sustainable value proposition, value creation and value capturing mechanisms bear economic benefits to the companies. Boons and Lüdeke-Freund [11] count four main characteristics of a sustainable business models distinguishing it from a conventional business model. They believe that the value proposition of sustainable business models is an ecological or social value in accordance with economic value. In the supply chain of sustainable business models suppliers feel responsibility towards the focal company's stakeholders as well. The sustainable business models encourage the sustainable consumption. Ultimately, Boons and Lüdeke-Freund [11] express that in design of the financial model of the sustainable business models, addition to the economic benefits, the company's ecological and social impacts are also considered. Abdelkafi &

231 Täuscher [22] define s as tools incorporating sustainability in the firms' value proposition and value  
 232 creation logic. Per se, sustainable business models not only provide value to their customer, but also  
 233 to the natural environment and society. Geissdoerfer, Bocken, and Hultink [23] consider sustainable  
 234 business models as a set of the elements in which the interrelation between these elements and their  
 235 interactions with the stakeholders create, deliver, capture, and exchange sustainable value for its  
 236 multi-stakeholders.

266  
267 **Figure 8.** Taxonomy of application categories of sustainable business models  
268  
269

270 Businesses with different characteristics from different industries are aided by sustainable  
 271 business models to achieve their sustainability ambitious. Besides, many researchers have  
 272 incorporated this concept with the other concepts to provide possible solutions for the businesses for  
 273 sustainable development. Further this section articulates in detailed how sustainable business models  
 274 are applied in the specific categories of innovation, management and marketing, entrepreneurship,  
 275 energy, fashion industry, healthcare industry, agri-food, supply chain management, circular  
 276 economy, developing countries, construction and engineering, hospitality industry.  
 277

## 278 3.1. Innovation

279 Much research has conducted on the common fields on innovation and which mainly strive to  
280 propose models, frameworks, or guidelines to elaborate how to innovate a sustainable business  
281 model or how to shift a traditional business model to a sustainable business model. Evans *et al.* [15]  
282 provide five paradigms for such transformation toward a sustainable business model.

283 Evans *et al.* [15] articulate that the first approach to design a sustainable business model is to  
284 design sustainable value that incorporates economic, social and environmental benefits  
285 conceptualized as value forms. According to Evans *et al.* [15], the second way to design a sustainable  
286 business model is to create a system of sustainable value flows among multiple stakeholders,  
287 including the natural environment and society as primary stakeholders. Generating a value network  
288 with a new purpose, design and governance is the third path toward a sustainable business model.  
289 The fourth paradigm to have a sustainable business model is to consider systemically the stakeholder  
290 interests and responsibilities for mutual value creation. Finally, internalizing externalities through  
291 Product Service System also enables innovation towards sustainable business models.

292 Geissdoerfer, Bocken and Hultink [24], inspired by design thinking, developed the concept of  
293 'Value Ideation' comprising value ideation, value opportunity selection, and value proposition  
294 prototyping. Based on the first principle of Evans *et al.* [15] model, the approach of Geissdoerfer *et al.*  
295 [24] to design a sustainable value proposition in which additional forms of value are  
296 created through identifying formerly underserved stakeholders (including society and environment)  
297 in the value proposition.

298 Likewise, "Value Triangle" is a new framework to design that is proposed by Biloslavo, Bagnoli  
299 and Edgar [25]. The VT is a tool allows a firm to capture economic value from a circular value system  
300 in which the value is co-created and co-delivered through the collaboration of the firm with its  
301 stakeholders. In other words, the value generated in value triangle is able to meet the benefits of  
302 customers (customer value), partners and suppliers (partner value), social actors including  
303 environment and future generation (i.e. public value), and the firm itself (captured value).

304 Oskam, Bossink, and de Man [26] propose the concept 'value shaping' for sustainability-  
305 oriented innovations that is able to clarify all the types of financial, social and environmental value  
306 that a business create by interacting with the different networks. They outline that depends on the  
307 place of the business model in the life cycle curve, different networks assist the business to design the  
308 value. Exploring value refers to the value the firm explores through the existing network and the  
309 social network of entrepreneurs. Developing value point out the firms shape their value proposition  
310 through engagement of the potential customers. Reframing value refers is the stage in which the  
311 feedbacks from the real customers are utilized to refine the delivered value. Finally, Oskam *et al.* [26]  
312 argue that redirecting value refers to shifting from the current value to other value/values due to  
313 change in mind-set of the firms; or redirecting value from the direct customers towards the end clients  
314 of the products.

315 Joyce and Paquin [27] provide a novel approach to design a sustainable business model. They  
316 propose a Triple Layered Business Model Canvas to meet the economic, social, and environmental  
317 benefits in which these three layers respectively explain how the value creation and delivering  
318 process satisfy the benefits of the business, society and the environment.

319 Roman, Liu, and Nyberg [28] propose a three-step approach to design a sustainable business  
320 model for transforming toward open access databases in which research data created from university

321 are accessible to industry for facilitating the open innovation process. Their model comprises three  
 322 stages of identifying the possible opportunities, recognizing the barriers, and finally designing the  
 323 model.

324 **Table 2.** Application of Sustainable business models in the innovation.

Author/s	Year	Contribution	Methodology	Data Source
Evans et al [15]	2017	Framework	Qualitative	Literature synthesis
Geissdoerfer, Bocken and Hultink [24]	2016	Framework	Qualitative	Literature synthesis, expert interviews, and multiple workshops
Biloslavo, Bagnoli and Edgar [25]	2018	Framework	Qualitative	Systematic literature review, case study
Oskam, Bossink, and de Man [26]	2018	Framework	Qualitative	Case study, interview, secondary data
Joyce and Paquin [27]	2016	Framework	Qualitative	Literature synthesis, secondary data
Roman, Liu, and Nyberg [28]	2016	Framework	Qualitative	Case study, interview

325

### 326 3.2. Management and Marketing

327 Business models have been considered as tools to implement the business strategies. Therefore,  
 328 it makes sense that the goals of the business models should be aligned with the organizations' goals.  
 329 Research has proved that designing a business model which can provide sustainability to the society,  
 330 environment and the business itself requires a prerequisite: providing sustainable values to the  
 331 society and the environment should be considered in the purpose of the organization, at first.

332 Stubbs [29] by studying the characteristics the sustainable business models of B Corporations  
 333 illustrates that social and environmental concerns are embedded in the mission and purpose of B  
 334 Corporations and the main goal of such corporations is to create positive societal impacts for its  
 335 stakeholders. He realized that such thinking affected the value propositions, value creation and value  
 336 delivering of B corporations and the B Corps align their profit and societal impact. It is worth  
 337 mentioning that businesses can be certified as B Corps that they have had the highest performance in  
 338 social and environmental standards, public transparency, and legal accountability.

339 Morioka, Bolis, Evans, and Carvalho [30] conducted a multiple case studies in eleven  
 340 organizations from diverse sectors, situated in Brazil and in the United Kingdom. They realized that  
 341 to integrate sustainability into sustainable business model's value creation and delivery system, the  
 342 organizations should firstly, make a connection between business purpose and employees' values  
 343 and believes, then they should be pro-active and clear engagement in solving sustainability problems.

344 In addition to aligning the goal of business model with the business's itself, the rule of decision  
 345 makers in implementing a business model should not be neglected. Kurucz, Colbert, Lüdeke-Freund,  
 346 Upward, and Willard [31] explain that how relational leadership advance the design and  
 347 assessment of sustainable business models. According to Kurucz *et al.* [31], relational leadership  
 348 processes that support strongly sustainable organization management help organizations to address  
 349 effectively the existing constraints and also to avoid contributing to the tightening of future limits of  
 350 the biosphere. They articulate that by engaging relational leadership in strongly sustainable business  
 351 model canvas (SSBMC) and the future-fit business benchmark (f2b2) organizations can define and  
 352 strive for their sustainability goals. Upward and Jones (2016) argue that the strongly sustainable

353 business model canvas demonstrates relational leadership characteristics that support business  
 354 modelling toward strategic sustainability. Additionally, Kurucz *et al.* [31] explain that the future-  
 355 fit business benchmark (f2b2) provides a 'fourth benchmark' which defines the ultimate goal of zero  
 356 negative impact on the socio-ecological system

357 A business model elucidates how a business makes money through value proposition, value  
 358 creation and value delivering. The core concept in business model is "value". The value that the  
 359 customer is ready to pay for it. Most of the marketing activities are dedicated in diagnosing the  
 360 customers' needs so as for providing such value for them. The next stream of research on the business  
 361 model sustainability, in the literature, is to engage the final users in the value proposition process. It  
 362 is one of the approaches ensuring the businesses to consider their benefits and design a sustainable  
 363 business model.

364 By studying firms that provide energy efficiency products and services Tolcamp, Huijben,  
 365 Mourik, Verbong, and Bouwknegt [32] found that utilizing a user-centered approach to design a  
 366 sustainable business model is the key to success of these firms. He realized that firms engage the  
 367 customers in designing their business model in form of a four-stage loop including: design of  
 368 involvement, facilitation of involvement, extraction of lessons learned and finally business model  
 369 adaptation. In other words, Tolcamp *et al.* [32] claim that identifying and incorporating the  
 370 customer needs into the firm's value proposition is of utmost importance in designing an effective  
 371 and sustainable business models.

372 Baldassarre, Calabretta, Bocken, and Jaskiewicz [33] , aided by principles user-driven  
 373 innovation, provide practical framework to design a sustainable business model through designing  
 374 a sustainable value proposition. User-driven innovation present solutions meeting the benefits of  
 375 society and the business, at the same time through an iterative process in which potential customers  
 376 are engaged in the design of value proposition.

377 De Bernardi and Tirabeni [34] perceive that designing a sustainable business model involves  
 378 designing a community-centered sustainable value proposition. They by combining principles from  
 379 both sustainable business model innovation and user-driven anti-consumption and well-being habits  
 380 they intended to design a sustainable business model that enhance sustainable and anti-consumption  
 381 behaviours. They studied the Italian Food Assembly, which is a successful example in Alternative  
 382 Food Network (AFN). De Bernardi and Tirabeni [34] found out two main factors have caused  
 383 Italian Food Assembly implemented a sustainable business model: 1) there is a strong knowledge  
 384 sharing of sustainable consumption behavior among the members and 2) there is an effective  
 385 distribution of best practices among them also.

386 **Table 3.** Application of Sustainable business models in the management and marketing.

### 387 3.3. Entrepreneurship

388 Davies and Chambers [35] argue that the sustainable entrepreneurs encounter with hybrid  
 389 tensions when they focus on creating economic value whilst increasing social or environmental value.  
 390 They argue that conflicts among different value capturing process leads in a business instability, and  
 391 a business model innovation is the solution to eradicate the conflict. Gasbarro, Rizzi, and Frey [36]  
 392 provides empirical insights how sustainable entrepreneurs cope with regulative, normative and  
 393 cultural-cognitive issues to increase institutions' legitimacy by developing a sustainable business  
 394 model. They articulate that institutional entrepreneurs (SIEs) designing innovative business models  
 395 by engaging the final customers and strategic partnerships in developing innovative value  
 396 propositions process to, firstly, increase the benefit of innovative sustainable business models,  
 397 secondly, to imitate the possible conflicts, and ultimately to change industry norms and social beliefs  
 398 and cultural-cognitive barriers in a value proposition so as for increase legitimacy within the  
 399 normative and cultural-cognitive institutions.

400 Khalid, Hassam, and Ahmad [37] consider the entrepreneurial action theory as an alternative  
 401 to entrepreneurship theory since it has an important role in the sustainable business innovation  
 402 model. Significant knowledge derived from entrepreneurial action provides a better understanding  
 403 about how to develop and establish sustainability-innovation ventures. Whilst, Neumeyer and  
 404 Santos [38] reveal that although the networks of sustainable entrepreneurial ventures are more  
 405 densely connected in compare to conventional entrepreneurs, sustainable entrepreneurs are  
 406 underrepresented, in the Southeast United States. [39] also provides empirical evidences that the  
 407 investors reluctant to invest on the sustainable start-ups, particularly those are environmentally  
 408 sustainable. On the other hand, de Lange [39] also illustrate that the investors are attracted to  
 409 invest on the start-ups in the sustainable national context.

410 **Table 4.** Application of Sustainable business models in the entrepreneurship.

de Lange [39]	2017	Empirical evidence	Quantitative	Secondary data

### 411 3.4. Energy

412 One of the objectives of sustainable business model is to eliminate (or at least minimize) the  
 413 harmful effect of the businesses on the environment. Many approaches are provided in the literature  
 414 for the businesses to reach this sustainable goal. Management of the resource and energy is of utmost  
 415 importance in meeting the sustainability goals. Moschetti, Brattebø, Skeie, and Lien [40] propose  
 416 an analytic process based on the execution of quantitative sustainability analyses, to transition from  
 417 a traditional focus of business models on economic value and customers toward proposing, creating,

418 and capturing sustainable values for the environment and the society. Sousa-Zomer and Cauchick  
 419 Miguel [41] investigate how such sustainable business model can support technological  
 420 innovations such as decentralized approaches for water quality and quantity improvements in urban  
 421 areas. Their founding revealed that having a sustainable business model through a close integration  
 422 with customers improve consumers' acceptance, risk perception, and confidence in decentralized  
 423 approaches.

424 Zhang, Guo, Gu, and Gu [42] propose a framework which assists the decision makers to  
 425 develop sustainable business models for high energy-consuming equipment (HECE). Aided by  
 426 Product Service System (PSS), they suggest a decision-making support tool for developing PSS of  
 427 HECE. In their opinion, in a sustainable business model the benefits of all the stakeholders are  
 428 considered. The illustrated that extra economic benefits impose more burdens and higher risk to the  
 429 environment. And developing PSS is not always sustainable as in gas supply service, for instance, it  
 430 would lead to extra economic and environmental burdens due to frequent transportation.

431 Rossignoli and Lionzo [43] provides empirical evidence of new forms of interdependencies  
 432 arising within partnership networks drive businesses in the energy sector to have a sustainable  
 433 business model. He believes that a network induces its contributors to expand their definition of  
 434 value and requires them to create value for both companies and society as the main objective of their  
 435 business model. According to Rossignoli and Lionzo [43], the new links among participants of a  
 436 network create new approaches for capturing value and assist them to solve the concerns related to  
 437 the resource dependency, which is achieving sustainability goals.

438 Nichifer [44] conducted a research to compare the current sustainable business models of the  
 439 current firms in the wind and solar energy sector in Romania. She finds that Both sectors have  
 440 encountered egregious changes in last two years due to the changes in supporting plans that affect  
 441 renewable energy markets and have developed them. In addition, Nichifer [44] found out these  
 442 supportive plans have attracted investors are a pessimistic outlook of future investments due to legal  
 443 instability that made them to reduce the wind projects.

444 **Table 5.** Application of Sustainable business models in the energy section.

Zhang et al. [42]	2018	Framework	Qualitative	Literature synthesis and case study
Rossignoli and Lionzo [43]	2018	Empirical evidence	Qualitative	Case study, interview, questionnaire
Nichifer [44]	2015	Empirical evidence	Qualitative	Case study, interview, questionnaire

### 445 3.5. Fashion

446 Pal and Gander [45] also believe that the traditional business models in the fashion industry  
 447 produce highly negative outcomes for the environment through high water usage, chemical  
 448 pollutions, and incineration or landfill of a large amounts of unsold stock. Ciasullo, Cardinali, and  
 449 Cosimato [46] also claim that the fashion industry is unsustainable as active companies in this  
 450 industry imposed many economic, social and environmental burdens. Therefore, many tools and  
 451 approach have emerged to design a sustainable business model for coping with these social and

452 environmental issues in the fashion industry. Kozlowski, Searcy, and Bardecki [47], for instance,  
 453 develop a new design tool, called the reDesign canvas, to assist sustainable designers in the fashion  
 454 industry. They propose a business model canvas with 12 building blocks ensuring the entrepreneurs  
 455 to build a sustainable fashion brand. Hirscher, Niinimäki, and Joyner Armstrong [48] aiding by  
 456 social manufacturing theory strived to design a more sustainable innovative value in design and  
 457 manufacturing of fashion. They use do-it-yourself (DIY), do-it-together (DIT) design strategies in  
 458 which users turned into the value creators to develop a sustainable business model.

459 Slow fashion is an approach aimed at intensifying sustainability in the fashion industry. Jung  
 460 and Jin [49] conducted a research to investigate the profitability this approach in the fashion  
 461 industry. Customer value creation framework, which is one of the slow fashion solutions, refers to  
 462 creating perceived customer value. They provide empirical evidence that participating the customers  
 463 in the value creation process increases their intention to pay a price premium for slow fashion  
 464 products. Jung and Jin [49] found out delivering creating customer value for slow fashion positively  
 465 affects consumers' purchase intentions which can secure an economically sustainable business model,  
 466 while it continuously ameliorating environmental and social sustainability.

467 Pal and Gander [45] argue that incongruence of fashion customers' value with the value  
 468 propositions and the barriers in transition of supply chain toward a slowing and a closing loop of  
 469 resources are detrimental to developing a sustainable business model in the fashion industry. [45]  
 470 believe that development of a business model should be considered as a system for creating value for  
 471 the customer and environmental and capturing value for the firm so that the firms can replace the  
 472 dominant, unsustainable model with sustainable business models in fashion industry.

473 **Table 6.** Application of Sustainable business models in the fashion industry.

Author/s	Year	Contribution	Methodology	Data Source

### 474 3.6. Healthcare Industry

475 Nikou and Bouwman [[50] conduct a systematic literature review based on a business model  
 476 ontology to find the applications of mobile technology and devices in the healthcare industry. Their  
 477 findings illustrate that in order for Mobile Technology contribute to the design of sustainable business  
 478 models in the healthcare industry, non-technological business model components such as value  
 479 proposition, organizing and revenue models should be considered rather than focusing on the service  
 480 platforms. In other words, to design a sustainable business model in the healthcare industry by  
 481 utilizing Mobile Technology, value propositions should be designed based on the customer's values  
 482 to provide social benefits and the value capture processes should be designed to provide economic  
 483 benefits. Merchant, Ward, and Mueller [51] claim that utilizing Telemedicine (also known as  
 484 telehealth) is a tool that provide sustainability to the hospitals. According to Merchant, Ward, and  
 485 Mueller [51], Telemedicine provides solutions to design value propositions to develop a sustainable  
 486 business model. Their results disclose that, although, hub hospitals are more responsible for the

487 design of sustainable business models in compare to the spoke hospitals in the U.S., both hub and  
 488 spoke hospitals pointed out that telemedicine helps them to meet their mission, facilitates access,  
 489 keeps lower-acuity patients closer to home, and helps head off competition. However, Anwar and  
 490 Prasad [52] argue that although telemedicine has presented many solutions for developing a  
 491 sustainable business models in the healthcare industry, adoption to such technology has turned into  
 492 the utmost importance. Because evolution and sometimes revolution in this technology has made it  
 493 hard to the users to get used to it. Anwar and Prasad [52] recommend a continuous eHealth  
 494 literacy so as for, firstly, facilitating the transition era and secondly, the development of new business  
 495 models in which the users' involvement and motivation and also the revenue generation have been  
 496 considered. They express that the telemedicine services should be user- friendly and sustainable  
 497 which are able to integrate all stakeholders' benefits in one system.

498 **Table 7.** Application of Sustainable business models in the healthcare industry.

Author/s	Year	Contribution	Methodology	Data Source

Merchant, Ward, and Mueller [51]	2015	Theoretical & empirical evidence	Qualitative	Literature synthesis, secondary data, and interviews
Anwar and Prasad [52]	2018	Framework	Quantitative	Literature synthesis

### 499 3.7. Agri-food

500 Research interest in providing sustainable solutions for developing business models in the agri-  
 501 food sector has increased in these years [53]. Franceschelli, Santoro, and Candelo [54] argue that  
 502 development of sustainable business model innovation within the food industry, especially for start-  
 503 ups, is of utmost importance, because the industry is itself linked with nature and human respect.  
 504 Barth, Ulvenblad, and Ulvenblad [53] by conducting a systematic literature review, proposes a  
 505 conceptual framework for sustainable business model innovation in the agri-food sector which can  
 506 meet the challenges encountered in taking a sustainability perspective.

507 Franceschelli *et al.* [54], contribute to the extant research by introducing the concept of  
 508 sustainable innovation within the business model literature. They utilize business model canvas to  
 509 design an innovative sustainable business model for food start-ups. Franceschelli *et al.* [54], propose  
 510 a sustainable business model based on business model canvas by providing sustainable solutions for  
 511 each component of the business model.

512 Lee and Slocum [55] study the meeting organizers who plans the meetings food and beverage  
 513 providers. They provide empirical evidences that such meeting organizers have selected to have a  
 514 sustainable business model by organizing the meetings for the local foods. Although they have a  
 515 contractual flexibility to select foods, there is a willingness to pay a price-premium for local products.  
 516 Lee and Slocum [55] also show that the meeting/event attendees have not considered themselves  
 517 sustainable yet and there is a need to increase the knowledge of and the benefit of local foods (which  
 518 are organic and harmless for the environment) to enhance the attendees' knowledge about  
 519 sustainability.

520 Robinson, Cloutier, and Eakin [56] prove that the landscaping enterprises have a sustainable  
 521 business model, thereby provide multifunctional edible landscapes in the cities, have a greater range  
 522 of value propositions and revenue streams resulting in increasing their competitive advantage. They

523 express that these enterprises can have the potential value creation of edible landscaping ranged  
 524 between \$3.9 and \$66 billion, and that positive return on investment (ROI) could be achieved within  
 525 one to five years.

526 **Table 8.** Application of Sustainable business models in the agri-food section.

Author/s	Year	Contribution	Methodology	Data Source
Barth et al. [53]	2017	Framework	Qualitative	Systematic literature review

Lee and Slocum [55]	2015	Empirical Evidences	Quantitative	Questionnaire
Robinson et al. [56]	2017	Empirical Evidences	Qualitative	Interview, and GIS landscape analysis

### 527 3.8. Supply Chain Management

528 Supply chain management is another sector has borrowed the concept of sustainability business  
 529 model as a possible solution to meet sustainable development. The objective of sustainability is to  
 530 address environmental and socio-economic issues in the long term [57]. Ray and Mondal [58]  
 531 provide evidences illustrate that collaboration is better than competition to sustain in the market.  
 532 They argue that collaboration among firms within a closed-loop supply chain (CLSC) leads in  
 533 sustainable business model in which the benefits of three bottom line concepts, i.e. protect  
 534 environment, improve economic performance, and social performance, can be met. Therefore, Ray  
 535 and Mondal [58] propose a collaborative business model and mechanism for collaborative  
 536 business strategies in a CLSC. Witjes and Lozano [57] also proved evidences classifying that  
 537 collaboration is crucial to develop sustainable business models for supply chain management. They  
 538 believe that collaboration between procurers and suppliers in the procurement process mitigate the  
 539 use of raw material and waste generation through the development of sustainable business models.  
 540 Witjes and Lozano [57] declare in a collaboration business model, suppliers and procurers gain  
 541 experiences in the collaboration process to improving circular economy objectives contribution and  
 542 to secure economic benefits for both parties, at the same time.

543 Geissdoerfer, Morioka, de Carvalho, and Evans [59] inspired by circular business model  
 544 concept and circular supply chain management concepts strive to design a sustainable framework to  
 545 provide solutions for sustainable supply chain management. They disclose that circular business  
 546 model provides different solution for different loops: closing loops, slowing loops, intensifying loops,  
 547 narrowing loops, and dematerializing loops.

548 Brennan and Tennant [60] conducted a comparative case study to find out how to resolve  
 549 trade-offs in sustainable supply chain management. They realized that for transition from a  
 550 traditional supply network toward sustainable supply network, business model innovation requires  
 551 to create sustainable values and resolve trade-offs. They illustrate how network-centric business  
 552 model innovation provides sustainable solutions for the trade-off between economic and  
 553 environmental benefit through the prioritization of sustainability-related 'cultural' resources.

554

555 **Table 9.** Application of Sustainable business models in the supply chain management.

Author/s	Year	Contribution	Methodology	Data Source

Geissdoerfer <i>et al.</i> [59]	2018	Framework	Qualitative	Literature synthesis, case study, interviews
Brennan and Tennant [60]	2018	Empirical Evidences	Qualitative	Case study and Interview

556 **3.9. Circular Economy**

557 Circular economy in the literature, has widely considered as a tool to implement and design a  
558 sustainable business model in the different sectors in response to current unsustainable trajectories.  
559 As it is shown in the table 9, Witjes and Lozano [57] and Geissdoerfer *et al.* [59] utilized this  
560 concept to design a sustainable business model for the area of supply chain management. In this  
561 section, will the other articles that have benefited from the Circular Economy for designing a  
562 sustainable business model are compiled and submitted.

563 Heyes, Sharmina, Mendoza, Gallego-Schmid, and Azapagic [61] applied the Backcasting and  
564 Eco-design for the Circular Economy (BECE) framework to identify how ICT firms diagnose circular  
565 business model innovations. BECE is designed for the product-oriented firms that is why Heyes *et al.*  
566 [61], by shifting the focus to a user-centered eco-design, design a circular economy models consistent  
567 with the company's priorities of customer satisfaction and profitability.

568 Todeschini, Cortimiglia, Callegaro-de-Menezes, and Ghezzi [62] by synthesizing of the  
569 current literature have developed an innovative circular business model in which the value  
570 propositions are sustainable and reduce environmental impacts. By conducting eight case studies on  
571 innovative fashion startups, they identify the concept of 'born sustainable' which assist the  
572 entrepreneurs to design sustainable value propositions to accomplish the circular economy  
573 objectives.

574 However, Stål and Corvellec [63] provide empirical evidence, based on seven case studies in  
575 Sweden, that businesses pro-actively looking for increase institutional demands for circularity to  
576 meet their own economic interests while that companies buffer their business model and their value  
577 proposition from emerging demands.

578 **Table 10.** Application of Sustainable business models in the circular economy.

Author/s	Year	Contribution	Methodology	Data Source
Heyes <i>et al.</i> [61]	2018	Framework	Qualitative	Literature synthesis, case study, workshop
Todeschini <i>et al.</i> [62]	2017	Framework	Qualitative	Literature synthesis, case study, interviews
Stål and Corvellec [63]	2018	Empirical Evidences	Qualitative	Literature synthesis, case study, interview

579 **3.10. Developing Countries**

580 Research conducted on sustainable business models in develop countries mainly address bottom  
581 of the pyramid (BOP) context, where there are paucity of resources and population suffer from  
582 poverty. Bottom of pyramid refers to the global poor who are in extreme poverty and are unable to  
583 meet basic needs [64], most of whom live in the developing countries. According to the World Bank

584 reports, 2.7 billion, which are around half the global population, have less than \$2 a day income [64]  
 585 . In the literature, sustainable business models or so called sustainable business models are consider  
 586 as tools to create values for both business and society. Designing a market-oriented business model  
 587 has been widely recommended for providing win-win solutions for multiple stakeholders.

588 Bittencourt Marconatto, Barin-Cruz, Pozzebon, and Poitras [65] provide evidences  
 589 illustrating the Brazilian government facilitates transition toward sustainable business model by  
 590 providing strategic and shared value opportunities. By study the Ecoelce project, they articulate how  
 591 to design a sustainable business model in the BOP context of Northeastern Brazil. Dembek, York, and  
 592 Singh [66] provide nine individual business models addressing poverty through studying 55  
 593 organizations in Indonesia and the Philippines. They create a BoP business model matrix to elaborate  
 594 how the identified business models create, offer, and capture value to benefit different stakeholders.  
 595 Goyal, Sergi, and Kapoor [67] provide strategic solution for the social enterprises to develop a  
 596 sustainable business model which can meet the underserved needs of the BoP segment in India. They  
 597 propose a practical framework for creating a sustainable, scalable and socially relevant ecosystem.  
 598 Palomares-Aguirre, Barnett, Layrisse, and Husted [68] study business models of three firms that  
 599 provide affordable housing for very poor people in Mexico. Their finding reveals that community  
 600 engagement and government collaboration are very important in creating and delivering a  
 601 sustainable value so as to better serve the BoP.

602 **Table 11.** Application of Sustainable business models in the developing countries.

Palomares-Aguirre <i>et al.</i> [68]	2018	Empirical Evidences	Qualitative	Literature synthesis, case study, interview

### 603 3.11. Engineering

604 Construction, the biggest industry in the developed world, has greatest environmental impact  
 605 [69] as well as economic and social consequences [40] . However, Selberherr [70] claim that  
 606 sustainable buildings bear many potential benefits for service providers and the society. Selberherr  
 607 [70] proposes strategies for the players in the construction sector to proactively contribute to  
 608 sustainable development of the society. She recommends that to design a sustainable business model  
 609 which is aimed at cooperatively optimizing buildings and infrastructures and taking the  
 610 responsibility for the operating phase via guarantees.

611 Wasiluk [71] provide empirical evidences that businesses in lieu of from justifying the  
 612 business case for sustainability they should concentrate on understanding how to mobilize their  
 613 intellectual capital to enhance an ecological sustainable and socially equitable enterprise. Indeed, she  
 614 considers the intellectual capital as a mediator sophisticating sustainable value proposition for the  
 615 Australian property and construction sector.

616 Boo, Dallamaggiore, Dunphy, and Morrissey [69] argue that there are approximately 190  
 617 million buildings in Europe which were built before energy efficiency was a common issue in  
 618 construction. They consider innovative business models (IBM) as a solution to provide sustainability

619 in the energy efficient building market. Boo, Dallamaggiore, Dunphy, and Morrissey [69] propose  
 620 sustainable business models ensuring long- lasting change in the energy efficient building market.  
 621 They believe that the co-evolution of business models with both the wider energy system and the  
 622 natural environment is crucial for the development of a sustainable business model.

623 **Table 12.** Application of Sustainable business models in the construction and engineering.

Author/s	Year	Contribution	Methodology	Data Source
Selberherr [70]	2015	Theoretical Evidences	Qualitative	Literature synthesis
Wasiluk [71]	2013	Empirical Evidences	Qualitative	Case study, interview
Boo <i>et al.</i> [69]	2016	Framework	Qualitative	Literature synthesis

624

### 625 3.12. Construction and real estate

626 Rajakallio, Ristimäki, Andelin, and Junnila [72] believe that the business model of the firms that  
 627 are active in the real estate and construction sector are tied with one another as these should be seen  
 628 as a network creating and delivering value to their client. Besides, they argue that to construct  
 629 sustainably the real estates, the clients play a vital role as the actual users of the buildings are often  
 630 tenants who appraise the quality of the real estates. They also debate that the buildings have been  
 631 traded in the investment markets, where the value is evaluated by the investor. Therefore, they  
 632 recommend a joint alignment of design themes in which are the stakeholders have the ability to  
 633 maximize their own private benefits. Whilst, this finding is in contrast with the findings of Bos-de  
 634 Vos, Volker, and Wamelink [73] who realized that engaging the final users in the value creation  
 635 step and the designing stage reduces the bargaining power of the firms which will finally lead in a  
 636 reduction in their economic benefits.

637 Rivière, Verges, Dimou, and Garde [74] investigate how they can design a network business model  
 638 for Beauséjour sustainable town project which is a project to build a tropical sustainable city in  
 639 Reunion Island - a small French island located in the Indian Ocean. The main challenge of the tropical  
 640 sustainable city is to cope with classic urban issues, environmental concerns and advocacy planning,  
 641 simultaneously. They were looking for a network business model that can explain how interaction  
 642 among the developer-contractor, real-estate developers (housing and services sector) and assets and  
 643 properties management enable them to build a sustainable tropical sustainable city. Their finding  
 644 reveals that in order for designing a sustainable business model, mix environmental issues with the  
 645 urban project objectives. Rivière *et al.* [74] argue that the urban objectives should be translated into  
 646 an environmental and bioclimatic sensitive design. Furthermore, the advocacy planning will allow  
 647 the inhabitants to take care of the plant heritage and contribute to the project.

648 The sharing economy, which is one of the principles of the circular economy, is a solution to reach  
 649 sustainability. Coworking spaces are also resulted from the concept of sharing economy. Waters-  
 650 Lynch and Potts [75] believe that the research on coworking spaces is disclosing differentiated  
 651 product niches in the urban office rental market. Waters-Lynch and Potts [75] provide a model  
 652 considering coworking spaces as 'social economy Schelling points' within the evolving landscape of  
 653 new spaces for urban production. According to the proposed model of Waters-Lynch and Potts [75]

654 , the coworking spaces entrepreneurially establish focal points for tacit coordination between niche  
655 actors who expect to find each other at such locations to cooperate on joint projects.

656 According to Yan, Wang, Quan, Wu, and Zhao [76] urban sustainable development efficiency  
657 (USDE) explains how the efficient an urban system is in meeting the human welfare and resources  
658 and the environmental input. Yan *et al.* [76] present a framework to evaluate the performance of  
659 urban sustainable development in utilizing natural resource limitations and meeting human welfare  
660 needs. Their model constitutes 11 specific indicators including water consumption, area of  
661 construction land, fossil energy consumption, life expectancy, government spending on education,  
662 living area, Engel's coefficient, percent of GDP contributed to others, green land area, days of fairly  
663 good air quality, sewage discharge.

664 Song [77] explains all the three main pillars of a sustainable business model (i.e. economic,  
665 environmental, and social benefits) for urban sustainable development. Song [77] presents a  
666 theoretical background on how to set up an eco-city for urban sustainable development. He argues  
667 that resource consumption is a very important element for sustainable development of the eco-cities.  
668 Song [77] claims that resource-saving and environment-friendly industries, and reduce resource  
669 consumption, reduce unit GDP resource consumption are the main pillars in the ecological city  
670 construction. Song [77] also debates that the construction of eco-cities, should be socially  
671 sustainable in order to reach the sustainable development objectives of urban areas. He believes that  
672 the objective of eco-cities is not only to protect the contemporary human rights, but also to ensure the  
673 development of human rights for the next generations. In the case of eco-cities, economic  
674 development includes the development of ecological agriculture, industry and services. Eco-  
675 efficiency and ecological benefits of economic development are very important in the construction of  
676 eco-city [77].

677 As mentioned above, the main objective of sustainable business models is to provide win-win  
678 solutions to meet the economic, social and environmental benefits at the same time. The aim of the  
679 study of Li *et al.* [78] was to develop indicators and an assessment method by which evaluate the  
680 status of urban sustainable development. They developed a system of 52 indicators of urban  
681 sustainable development that address economic growth and efficiency, ecological and infrastructural  
682 construction, environmental protection, social and welfare progress. Li *et al.* [78] also developed a  
683 Full Permutation Polygon Synthetic Indicator method for evaluation of the capacity for urban  
684 sustainable development at different times for the next two decades.

685 Many approaches have proposed in the literature for developing sustainable constructions, the  
686 constructions are both eco and socio friendly. While determining the economic value of such  
687 constructions is of utmost important. Zavadskas *et al.* [79] developed a neutrosophic Multi-  
688 Attribute Market Value Assessment (MAMVA) method to determine the real market value of  
689 property incorporating sustainability aspects. The MAMVA by utilizing the multiple criteria analysis  
690 evaluates sustainable buildings considering the vagueness aspects of the initial information. They  
691 argue that this method can assist property sellers, brokers, buyers, and lenders on regional, national  
692 and global levels also.

695

696 *3.13. Mobility and transportation*

697 One of the most important challenges toward global sustainable development is Urban  
698 transformation as mobility sector has a great potential to reduce the carbon emission [80]. The  
699 disruptive business model innovation emerged app-based smart-sharing systems such as car-  
700 pooling, expanded electric vehicle use, and bike-sharing. Such sharing mobility business models plus  
701 low-carbon transport modes in cities, are able to lead urban mobility toward sustainability. Ma,  
702 Rong, Mangalagiu Thornton, and Zhu [80] study the relationship between the social-ecological  
703 innovation in the sharing economy and the urban sustainable development. Conducting three  
704 business cases in the emerging sharing mobility sector –ride-sharing, EV-sharing and bike-sharing -  
705 in Shanghai, China, illustrate that there is a strong co-evolution mechanism between the transition  
706 towards sustainable city and the business ecosystem innovation towards greener and smarter  
707 transport. Ma *et al.* [80] believe that the disruptive innovation of the sharing economy is the  
708 common area linking this interaction.

709 Mozos-Blanco, Pozo-Menéndez, Arce-Ruiz, and Baucells-Aletà [81] analyze the effectiveness of  
710 Sustainable Urban Mobility Plans (SUMP) in 38 of the Spanish Network of Smart Cities, in 2018. The  
711 sharing economy principles, which is one of the approaches of implementation of circular economy,  
712 is the main criteria has considered in the SUMP) in the Spanish Network of Smart Cities. Their finding  
713 discloses that although the most of mobility plans tend to improve the pedestrian and cycling  
714 mobility, but there is a need to provide the required software and hardware infrastructures. Car-  
715 pooling or car-sharing does not have any remarkable share in transportation in Spain, therefore  
716 parking regulation is another criterion has emerged in SUMP) to restrict the presence of parking areas  
717 around office buildings and residential areas. Mozos-Blanco *et al.* [81] argue that the criterion  
718 which has considered in SUMP) to meet the social and environmental benefits objectives, which are  
719 of the principles of implementation of sustainable business model in urban development, are the  
720 reduction of air and noise pollution and stablishing urban green spaces.

721 Lyons [82] provides theoretical evidences about smart urban mobility and they believe that the  
722 terms of smart and sustainable are strongly tied with each other. Lyons [82] argues that for  
723 development of smart cities only technological development is not adequate, but also there is a need  
724 for sociotechnical development to reach the smart urban mobility. He also believes that the  
725 appreciation of people's lifestyles, constraints, needs, desires and behaviors as well as the practices  
726 of businesses are of the main requirements of achieving the smart urban mobility objectives. In  
727 addition, Lyons [82] debates that ICT plays a vital role in supporting how society connects and it  
728 can determine address effectiveness and attractiveness of mobility for the user.

729 Nowickaa [83] believes that sustainable mobility integrates realization of the needs of  
730 stakeholders by using remote access to the properties of desired goods and services. From his point  
731 of view, utilizing the cloud computing model in mobility lead to achieve the sustainable mobility:  
732 minimize the negative impact on the environment, increase the social and economic benefits.  
733 Nowickaa [83] argues that the use of cloud computing models reduces the total cost of provided  
734 services for residents; provides agility, flexibility, and elasticity; quick and cost-efficient reaction to  
735 less-predictable events and changing stakeholders' requirements; globally accessible services, easy  
736 and fast implementation and strong support for sustainable development.

737 Köse *et al.* [84] believe that sustainable manufacturing provides competitive advantages to the  
738 companies and despites the pressure of stakeholders such as customers, investors, competitors,  
739 interest groups and local municipals, companies voluntarily overcomply with social and  
740 environmental norms to take advantage of being sustainable. Köse *et al.* [84], by studying the  
741 incentives in the urban mobility to apply sustainable approaches, disclose that the common  
742 incentives and strategies of overcompliance and sustainability drives public and private initiatives  
743 toward a sharing economy. They realize that the companies design their strategies under the effects  
744 of overcompliance with social and environmental aspects to improve sustainability. Köse *et al.* [84]  
745 suggest that differentiating existing product lines in favor of sustainability (e.g. electric cars, bamboo  
746 bicycles) or by introducing new products that can offer even higher sustainability (e.g. the SUW) can  
747 be the possible strategies for the manufacturing industry to overcompliance with social and  
748 environmental requirements

749 Zawieska and Pieriegud [85] consider smart cities and the sustainable transportation particularly  
750 with regard to the reduction of CO2 emissions. They believe that meeting the reduction targets set by  
751 the European Union 2011 White Paper on Transport will be very challenging and it is needed for a  
752 profound transformation of transport and energy sectors. Zawieska and Pieriegud [85] also  
753 believe that the smart city solutions can mitigate transport CO2 emissions and meet the reduction  
754 goals.

755

757

758 **3.14. Hospitality Industry**

759 Hotels are counted one the most important sectors of hospitality industry which have affected  
 760 by sustainability movement. The research is done in the common field of business model  
 761 sustainability and hotels are still in the infancy stage. Qua most of the studies have tried to investigate  
 762 the sustainability level of the hotels rather than providing solutions for development of a sustainable  
 763 business model.

764 Buffa, Franch, and Rizio [86], utilizing a quantitative approach, provide empirical evidences  
 765 that medium-sized hotel enterprises (SMHEs) in Trentino, a traditional tourist destination in the  
 766 Italian Alpine Arc, apply sustainable business models. They argue that these SMHEs adopted three  
 767 different sets of environmental management practices (EMPs) to accomplish their sustainability goals  
 768 of their business models.

769 Høgevold, Svensson, Padin, and Dos Santos [87] compare the different between sustainable  
 770 business models in manufacturing companies and hotels as a service sector. They believe that the  
 771 nature of the industries is very effective in the models they have selected to meet the sustainability  
 772 objectives. Tangibility and intangibility of the products and services influence the assessmentability  
 773 of the social and environmental impact of their economic activities.

774 Results of the research of Melissen, Cavagnaro, Damen, and Düweke [88] disclose that the  
 775 current business models of hotel industry are not able to meet the sustainability objectives, especially  
 776 with respect to addressing guests' needs and wants and (subsequent) institutionalization of  
 777 sustainability. Nonetheless, they argue that managers' willingness and capabilities are potentially the  
 778 sources stimulating them to transit toward a sustainable business model.

779 Høgevold and Svensson [89] develop a sustainable business model for the hotels based on a  
 780 case study they have conducted among a major Scandinavian hotel chain known for having  
 781 implemented sustainable business practices within the company and in its business network. They  
 782 are the only study that have provided sustainable solutions for different element of business model  
 783 in which the benefits of multi-stakeholders have considered in value creating and capturing  
 784 processes.

785

787

#### 4. Discussion

788

789

790

791

792

793

794

795

This study provides a comprehensive review on the applications of sustainable business models in different industries, sectors, and research area. Energy, fashion, healthcare, food, construction and hospitality are industries have resorted to the principles of sustainable business models for realization of sustainable development. Entrepreneurship, management and marketing, innovation, circular economy, and supply chain management are research areas have utilized sustainable business models to provide solutions to achieve their sustainability ambitious. Application of sustainable business models in the developing countries is another category has emerged in the initial screening phase of the literature.

796

797

798

799

800

801

802

803

804

805

806

807

808

Finding reveals that circular business models, base of the pyramid, product service systems, are the major strategies have considered in the literature to design sustainable business models that is quite consistent with the findings of Bocken *et al.* [14]. Many authors consider designing a sustainable value proposition as an approach to design a sustainable business model. In this regard, Geissdoerfer *et al.* [24], Biloslavo *et al.* [25], Oskam *et al.* [26], Tolkamp *et al.* [32], Baldassarre *et al.* [33], De Bernardi and Tirabeni [34], and Hirscher *et al.* [48] have presented innovative approaches in which customers are engaged in the designing process to devise a sustainable value proposition. Hirscher *et al.* [48], for instance, utilize do-it-yourself (DIY) and do-it-together (DIT) design strategies to design a more sustainable innovative value proposition. Geissdoerfer *et al.* [24], inspired by design thinking, developed the concept of value ideation to design a sustainable value proposition comprising additional values all stakeholders (including society and environment) in the value proposition. Oskam *et al.* [26] propose the concept value shaping to develop financial, social and environmental value that a business create by interacting with the different networks.

809

810

811

812

813

814

815

Studying the role of managers in designing sustainable business models is a topic has considered in the common area of literature of business and management and business model sustainability. Kurucz *et al.* [31] debate that relational leadership processes that support strongly sustainable organization management help organizations to meet their sustainability ambitious. On the other hand, Stubbs [29] believe that those organizations have embedded the social and environmental concerns in their mission and their purpose have been successful in achieving their sustainable business model goals.

816

817

818

The main issue emerged in the application of sustainable business models in entrepreneurship is that despite there is a remarkable demand on the sustainable businesses, sustainable entrepreneurs are underrepresented [39] and the investors reluctant to invest on the sustainable start-ups,

819 particularly those are environmentally sustainable [39]. Whilst, Davies and Chambers [35] and  
820 Gasbarro *et al.* [36] consider business model sustainability innovation as the solution to conquer  
821 the barriers to implementing an sustainable business model.

822 Much research is conducted on developing solutions for sustainable business models to manage  
823 the resource and the energy as Moschetti *et al.* [40], Sousa-Zomer and Cauchick Miguel [41], and  
824 Zhang *et al.* [42] propose frameworks and approaches to develop sustainable business models  
825 provide values to the energy resources. Rossignoli and Lionzo [43] also recommend partnership  
826 networks is a solution that assisting businesses in the energy to provide sustainable value  
827 propositions.

828 Pal and Gander [45] also believe that the traditional business models in the fashion industry  
829 produce highly negative outcomes for the environment through high water usage, chemical  
830 pollutions, and incineration or landfill of a large amounts of unsold stock. Therefore, sustainable  
831 business models are considered as a solution to minimize such negative effects. The most prevalent  
832 approach in designing a sustainable business model in the fashion industry is to participating the  
833 customers in the value creation process [48],[49]. On the other hand, Pal and Gander [45] believe  
834 that creating value for the customer and environmental and capturing value for the firm is the  
835 solution to eliminate the barriers in transition of traditional supply chain toward a slowing and a  
836 closing loop of resources and toward a sustainable business model in the fashion industry.

837 The healthcare is another industry utilizes sustainable business models to achieve sustainability  
838 goals. Surprisingly enough, the found articles have used sustainable business models to address  
839 sustainability issues have aided digital technologies. In other words, the common literature of  
840 business model sustainability and healthcare are tied with digital technology. As Merchant *et al.* [51]  
841 and Anwar and Prasad [52] consider Telemedicine as a solution to design value propositions to  
842 develop a sustainable business model in healthcare industry. In addition, Nikou and Bouwman [50]  
843 believe that utilizing the mobile technology can design a sustainable business model in the healthcare  
844 industry.

845 The supply chain sector is the other sector that is found in the literature which has utilized the  
846 principles of the sustainable business model to provide solutions to reach the sustainability  
847 development [57]. Ray & Mondal [58], Geissdoerfer *et al.* [59], and Brennan and Tennant [60]  
848 argue that collaboration and networks among firms within a closed-loop supply chain (CLSC) leads  
849 in sustainable business model in providing benefits to three bottom line concepts of protect  
850 environment, improve economic performance, and social performance. Since it the supply chain  
851 concept implies B2B relationships between the suppliers and buyer, such networks and collaboration  
852 can resulted in quarantinable consumption and according to Witjes and Lozano [57] it reduces the  
853 use of raw material and waste generation also. Finding exposes that the Bottom of pyramid has  
854 centered in the hotspot of designing sustainable business models in in develop countries. It is found  
855 that sustainable business models offer solutions such as designing a market-oriented business model  
856 to provide win-win solutions for multiple stakeholders. The research in the common field of business  
857 model sustainability and hotels, as the most important sectors of hospitality industry, are still in the  
858 infancy stage as most of the studies have tried to investigate the sustainability level of the hotels  
859 rather than providing solutions for development of a sustainable business model.

860 Illustrating the research path and articulating in detail the application of sustainable business  
861 models in different industries, sectors, and research area are the contributions of this study that

862 provide insights and the possibility of compressions for both practitioners and researchers who are  
863 eager to find sustainable solutions through sustainable business models. Different approach has  
864 revealed and to design a sustainable business model and the most come one was designing a  
865 sustainable value proposition which is able to provide values to multi-stakeholders such as society  
866 and environment while it can be profitable for the organization. Sustainable value creation and value  
867 delivering plus B2B partnerships are other solutions have emerged in the literature for developing a  
868 sustainable business model.

## 869 5. Conclusions

870 The process of sustainable business model construction forms an innovative part of business  
871 strategy. Different industries and business types have utilized sustainability business models to  
872 satisfy their economic, environmental and social goals simultaneously. This study is conducted to  
873 present the state of the art of sustainable business models in various application areas. The business  
874 models are classified and reviewed in different application groups. To do so, a review is conducted,  
875 and the findings reveal that the application of sustainability business models can be classified in 16  
876 unique categories. The key contribution of this study is providing an insight about the state of the art  
877 of sustainable business models in various application areas and its research path. It is found that  
878 sustainable business models offer solutions such as designing a market-oriented business model to  
879 provide win-win solutions for multiple stakeholders. The research in the common field of business  
880 model sustainability and hotels, as the most important sectors of hospitality industry, are still in the  
881 infancy stage as most of the studies have tried to investigate the sustainability level of the hotels  
882 rather than providing solutions for development of a sustainable business model.

883 Illustrating the research path and articulating in detail the application of sustainable business  
884 models in different industries, sectors, and research area are the contributions of this study that  
885 provide insights and the possibility of compressions for both practitioners and researchers who are  
886 eager to find sustainable solutions through sustainable business models. Different approach has  
887 revealed and to design a sustainable business model and the most come one was designing a  
888 sustainable value proposition which is able to provide values to multi-stakeholders such as society  
889 and environment while it can be profitable for the organization. Sustainable value creation and value  
890 delivering plus B2B partnerships are other solutions have emerged in the literature for developing a  
891 sustainable business model.
