<https://orcid.org/0000-0002-3810-9592>**Abstract**

Socio-demography of statuses reflects the demographic and social roles and achievements of an individual(s) in a population. In the theoretical frameworks, little was known about the theory, analytical measures, and evolutionary mechanism of the socio-demographics of statuses of an individual(s). In this paper, three (3) methodological issues regarding the concept of socio-demographics were proposed, these are: (a) identified the basic features that clarify our understanding about the conception of the socio-demographic statuses of an individual(s) as common, universal, and desirable positions, achievements, and advantages every individual strives and competes to attain, achieve, maintain, update, and upgrade which are determined by biological and social environments, driven and regulated by a continuum of competitions and natural selections; (b) presented a new paradigm of analytical measures of an individual's socio-demographic statuses and the established hierarchical transitions; (c) proposed theoretical assumptions for the evolution of a socio-demographically unique population. Seven (7) factors (the driving forces) and eight (8) conditions responsible for the evolution of socio-demographically unique populations were identified and explained. The evolutionary transitions were organized into six (6) socio-demographic ranks.

**Keywords:** Socio-demographic positions; Socio-demographic success; Socio-demographic evolution; Socio-demographic hierarchy; Analytical measures.

**1. Introduction**

In our daily life, we proud to compete within the social environment because of the social positions and successes we have attained. In an academic, occupational, and family structure, we proud of our socio-demographic profiles (statuses). Likewise, social communities and societies proud of their individual socio-demographic profiles which are indicators of their socio-economic development.

When we think of our socio-demographic characteristics, we think of what social attributes and elements (e.g education, occupation, family structure), and advantages are essential for us to competes and acquire. We also reflect on what biological and demographic advantages (e.g biological sex and age) we have acquired in our life and survival. Each of us competes for socio-demographic advantages with varying gratifications and speeds. Our speed for the attainment of the highest socio-demographic statuses (socio-demographic position and success) are controlled and regulated by biological and social competitions, and also influenced by the biological and social environments. This competitive regulation and influences of biological and social environments result in the evolution of a socio-demographically unique population of individuals. Demographers, sociologists, social psychologists, and evolutionary biologists are highly interested in the mechanism responsible for these socio-demographic changes in a population of individuals.

In research, socio-demographic characteristics of a population or individual have been essentially investigated to provide a correlated understanding of a certain phenomenon. For instance, in medical research, lifestyle diseases, disease occurrences, disease severity, and disease susceptibility are correlated

## Socio-Demographic Statuses

with socio-demography (Trent & South 1992; Ramirez et al. 1993; Kravdal 2002; Skrzypczak 2009; Bai et al. 2015). However, it is a philosophical tradition that population research is accompanied by socio-demography (Thomas et al. 2006). Despite this philosophy, description, and judgment of population or individual's socio-demographic characteristics is mostly based on frequencies and percentages, odd ratio, cluster statistics are usually used. Higher and advanced statistical analyses (such as ANOVA and its counterpart nonparametric approaches) are impossible because: (a) suitable sociometric analysis is inaccessible to cumulate the results of all socio-demographic attributes into one meaningful result, thus the socio-demographic attributes in question are correlated and presented separately, (b) it is difficult to be express the result as per-respondent. Moreover, the literal and theoretical meaning of what socio-demographic statuses refers to dictionaries and theoretical works have not presented clear theoretical explanations and methodological analysis. Furthermore, even the well-established social theories of Karl (1959) and Max (1921/2015) about social hierarchy and status are based on one or two attributes (such as prestige, power, dominance, materialism (property), productivity, occupation, or skills) and has no clear analytical guidelines.

This article attempt to provide an empirical meaning of what scientists means by socio-demographics of statuses, how it can be analyzed and the theories that explain its evolution in a population of individuals.

## 2. Socio-demographic Statuses: The General Features

- Socio-demographic statuses refer to the sociological and demographic attributes acquired by an individual(s) in a population that determines his/her socio-demographic positions or niches, socio-demographic roles, and as well as the correlating socio-demographic advantages he/she attains and succeeds. It informs us about the socio-demographic profile of an individual(s).
- Socio-demographic statuses are motivational construct. It is comprised of common, universal, and desirable positions, achievements, and advantages every individual strives and competes to attain, achieve, maintain, update and upgrade. The commonality and universality nature of socio-demographic statuses distinguish it from race, ethnicity, religiosity, urbanization, geographical location, materialism, and social power.
- Socio-demographic statuses transcend a specific attribute. It integrates several universal attributes common to all people (such as education, occupation, family, and others) and common to all populations (such as biological sex and age).
- Socio-demographic attributes are ordered and ranked by acquisition and advantage respectively relative to others. The acquisition of socio-demographic attributes follows an ordered system one upon the other over time. Within each acquired attribute there exist varying degrees of elements (advantages) ordered in a continuum of ranks.

First acquired attribute: age (elements: childhood, adolescent, and adulthood) → second acquired attribute: education (elements: basic/student, post-basic/teacher, tertiary/researcher) → third acquired attribute: occupation (elements: lower class, middle class, and higher class) → fourth acquired attribute: family (elements: separated/divorced, widow and married).

The number of elements within each attribute depends on the social construct of the population, and the categories established. Each element represents an order of acquired advantage relative to the other elements. These elements are created by a continuum of competition (through genetic competition → physiological competition → demographic competition → psychosocial competition).

- Socio-demographic statuses are biologically and socially (i.e biological and social environments) acquired and controlled in a systematic and hierarchical order of interrelated elements. Such elements form the basis of variability within each socio-demographic attributes.  
Sex is biologically acquired. Age is acquired by the combination of biological and social environments. education, occupation, and family are all acquired in a social environment.
- Socio-demographic statuses identify the socio-demographic uniqueness (mechanism through the continuum of competition → genetic selection → physiological selection → demographic selection → psychosocial selection → psychosocial fitness → socio-demographic evolution) of an

Socio-Demographic Statuses

individual(s). Socio-demographic position and socio-demographic success are two correlating factors that define the socio-demographic statuses of an individual(s).

3. Socio-demographic Statuses

Socio-demographic statuses define the socio-demographic position (social configuration) and socio-demographic success (socio-demographic score) an individual(s).

3.1. Socio-demographic Position (SDP)

Socio-demographic positions refer to the common, universal, and desirable social niches and roles everyone is competing and striving to attain, acquire, update, and upgrade in a social structure. It informs us about the socio-demographic position and role of an individual(s) regardless of the degree of his/her success. For instance, one might desire to become an emirate professor, a consultant engineer, a consultant medical doctor, a businessman, a permanent secretary, a great grandfather/mother of his/her children, or hope to attain a combination of some of these positions, within a competitive population regardless of whether he/she made significant achievements relate to that position. Socio-demographic positions can be numerically measured by socio-demographic configuration (SDc).

**3.1.1. Socio-demographic configurations (SDc).** It expresses the socio-demographic niches and roles of an individual(s) in a population. The assessment of socio-demographic configuration requires empirical data collected by an established questionnaire. The collected data is then organized, ranked based on the degree of advantage acquired from a set of socio-demographic elements in each socio-demographic attributes. The socio-demographic element's rank number is then sociometrically analyzed using a multivariate compression (Abdullahi, 2019) to obtain the configuration result.

**3.1.2. The instrument for Data Collection.** A structured questionnaire is used in this case. The items of the questionnaire should present the appropriate selection of the common and universal socio-demographic attributes and their elements. Regarding the coding of the questionnaire elements, An N-gab scaling (such as one-gab, two-gab, and three-gab scaling.) of Abdullahi (2019) can be used appropriately. (Figures 1 and 2 provided a sample of questionnaires that can be used.

Sex	Age	Sub-age	Education	Occupation	Marital status
Female [1] Male [2]	Childhood [3]	0-3 yrs [3]	None [0] Basic [3] Post basic [6] Tertiary [9]	Unemployed [0] Lower scale [3] Middle scale [6] Higher scale [9]	Bachelor [0]
		4-6 yrs [6]			Divoreced [3]
		7-9 yrs [9]			Widow(er) [6]
	Adolescence [6]	10-15 yrs [3]			Married [9]
		16-20 yrs [6]			
		21-25 yrs [9]			
	Adulthood [9]	26-40 yrs [3]			
		41-55 yrs [6]			
		Abv. 56 yrs [9]			

**Figure 1:** Sample of questionnaire instrument for the analytical measure of common socio-demographic position.

## Socio-Demographic Statuses

Sex	Age	Sub-age	Education	Occupation	Marital status
Female [1] Male [2]	Childhood [3]	0-3 yrs [3]	None [0] Student [3] Teacher [6] Researcher [9]	Unemployed [0] Lower scale [3] Middle scale [6] Higher scale [9]	Bachelor [0] Divoreced [3] Widow(er) [6] Married [9]
		4-6 yrs [6]			
		7-9 yrs [9]			
	Adolescence [6]	10-15 yrs [3]			
		16-20 yrs [6]			
		21-25 yrs [9]			
	Adulthood [9]	26-40 yrs [3]			
		41-55 yrs [6]			
		> 56 yrs [9]			

**Figure 2:** Sample of questionnaire instrument for the analytical measure of common socio-demographic position.

**3.1.3. The instrument for Sociometric Data Analysis.** Due to the consideration for multiple socio-demographic attributes, a multivariate compression (Abdullahi, 2019) can be used to calculate the socio-demographic configuration. It is expressed by equation (1) and (2) as follow:

$$SDc = \left( \frac{FSERN}{1} + \frac{SSERN}{10} + \frac{TSERN}{100} + \dots \dots \dots \frac{xSERN}{10^y} \right) - 1 \dots \dots \dots (1)$$

If the socio-demographic attribute is uncommented by the biological sex attribute, the equation become

$$SDc = \left( \frac{FSERN}{1} + \frac{SSERN}{10} + \frac{TSERN}{100} + \dots \dots \dots \frac{xSERN}{10^y} \right) \dots \dots \dots (2)$$

Where:

$y = (0, 1, 2, 3, \dots \dots \dots)$

$SDc$  = Socio-demographic configurations.

$FSERN$  = Socio-demographic element's rank number of the first acquired attribute.

$SSERN$  = Socio-demographic element's rank number of the second acquired attribute.

$TSERN$  = Socio-demographic element's rank number of the third acquired attribute.

$xSERN$  = Last socio-demographic element's rank number of the last acquired attribute.

Note: A specific attribute (e.g biological sex, or any others) can be uncommented (i.e eliminate or ignore its role as a source of variability within) without altering the pattern, order, system, hierarchy, and the rules. For instance, 2.9639 of a male socio-demographic position can be uncommented by biological sex, or family attribute to 0.9639 or 2.9630 respectively.

**3.1.4. Result of Sociometric Data Analysis.** The socio-demographic configuration of an individual(s) is not to be approximated, because each digit of the configuration represents a particular attribute. The number of digits determines the number of socio-demographic attributes an individual acquired, and differences in each digit over others represent a variation within the individuals in the population. If the first digit of the  $SDc$  result is uncommented (i.e biological sex), a higher  $SDc$  shows a higher social advantage, position, and role.

It is possible to run many statistical analyses with the calculated results of sociometric analysis because the result can be calculated per individual. The per-respondent result provides an analysis of variation that exists between individuals in a given sampled population. Other factors such as race, ethnicity, religiosity, urbanization, geographical location, and value system can be considered as an independent source of variations.

## Socio-Demographic Statuses

### 3.2. Socio-demographic Success (SDS)

Socio-demographic success refers to the common, universal, and desirable social achievements, victories, triumphs everyone is competing and striving to attain, acquire, update, and upgrade in a social structure. It informs us about the socio-demographic achievements of an individual(s) regardless of his/her position(s). For instance, one might desire to become the most successful professor, the most successful engineer, the most successful medical doctor, the most successful businessman, the most successful civil servant, etc, within a competitive population regardless of his/her socio-demographic positions. Socio-demographic success can be numerically estimated by Socio-demographic scores (SDs).

#### 3.2.1. Different forms of socio-demographic success

Depending on the social specification of a given population, the following socio-demographic successes can be evaluated.

- i. Common socio-demographic success. This is common socio-demographic structure. and apply to all individuals. It is a general and common approach irrespective of one expertise (Refer to figure 3 and 4). For a guided example of a questionnaire approach and the ranking of its socio-demographic elements.
- ii. Academic socio-demographic success. Socio-demographic success in an academic structure and environment (Refer to figure 5). For a guided example of a questionnaire approach and the ranking of its socio-demographic elements.
- iii. Business socio-demographic success. Socio-demographic success in a business structure and environment (Refer to figure 6). For a guided example of a questionnaire approach and the ranking of its socio-demographic elements.
- iv. Occupational socio-demographic success. Socio-demographic success in an occupational structure and environment (Refer to figure 7). For a guided example of a questionnaire approach and the ranking of its socio-demographic elements.
- v. Family socio-demographic success. Socio-demographic success in a family structure and environment (Refer to figure 8). For a guided example of a questionnaire approach and the ranking of its socio-demographic elements.

**3.2.2. Socio-demographic score (SDs).** It expresses the measure of the socio-demographic achievements of an individual(s) in a socially specified population. The assessment of socio-demographic score requires empirical data collected by an established questionnaire. The collected data is then organized, ranked based on the degree of achievements acquired from a set of socio-demographic elements in each socio-demographic attributes. The socio-demographic element's rank(s) number is then sociometrically analyzed using a new approach here presented to obtain the socio-demographic score.

**3.2.3. The instrument for Data Collection.** A structured questionnaire is used in this case. The items of the questionnaire should present the appropriate selection of the common and universal socio-demographic attributes and their elements. Figure 3-8 provided a sample of questionnaires that can be used. The distinction between these questionnaires and that use in SDP assessment is that the number and the description of elements for a particular socio-demographic attribute vary and more specifically, elaborated respectively. It also selects only one social attributes. More than one element can be considered as acquired advantages and is also considered in the sociometric calculations.

## Socio-Demographic Statuses

		Abv. 56 yrs [3]			

**Figure 8:** Sample of questionnaire instrument for the analytical measure of family socio-demographic success.

**3.2.4. The instrument for Sociometric Data Analysis.** A new method is proposed here to calculate the socio-demographic score of an individual(s) in a population. It is expressed as the powered sum of socio-demographic ranks of all the socio-demographic attributes acquired by the individual in a socially specified population. It is expressed by equation (2) as follow:

## Socio-Demographic Statuses

$$SDs = (FSERN)^0 + (FSERN)^1 + (FSERN)^2 + (FSERN)^x \dots \dots \dots (2)$$

Where:

$x = (0, 1, 2, 3, \dots \dots \dots)$

$SDs$  = Socio-demographic score

$FSERN$  = Socio-demographic element's rank(s) number of the first acquired attribute.

$SSERN$  = Socio-demographic element's rank(s) number of the second acquired attribute.

$TSERN$  = Socio-demographic element's rank(s) number of the third acquired attribute.

$xSERN$  = Last socio-demographic element's rank(s) number of the last acquired attribute.

Note: A specific attribute or sub-element (e.g biological sex, or any others) can be uncommented (i.e eliminate or ignore its effect as a source of variability within) without altering the pattern, order, system, hierarchy, and the rules.

**3.2.5. Result of Sociometric Data Analysis.** The higher SDs show higher social achievement and success in a socially specified population. It is also possible to run many statistical analyses with the calculated results of sociometric analysis because the result can be calculated per individual. The per-respondent result provides an analysis of variation that exists between individuals in a given sampled population. Other factors such as race, ethnicity, religiosity, urbanization, geographical location, and value system can be considered as an independent source of variations.

#### 4. Mechanism of Socio-demographic Evolution

The mechanism for the evolution of socio-demographic positions and successes of an individual(s) that identifies socio-demographic uniqueness is explained by two theoretical assumptions. Socio-demographic uniqueness results in the evolution of a new socio-demographic population. What the issue socio-demographic evolution is trying to explain is the mechanism that drives and links population biology, demography, and social structure.

##### 4.1. First Theoretical Assumption.

It states that when nature selects an individual from a competing environment, he/she receives the most influence and the most advantages from the biological and social environments that prepare him/her socially and psychologically fit for the attainment and achievement of different status of socio-demographic positions and successes with varying speed and degree of uniqueness.

In common social phenomena, social success is related to age and time. But biologically and environmentally advantaged (socially selected) individual(s) would move the fastest speed to reach that target socio-demographic transition everyone is striving to attain, achieve, maintain, update, and upgrade. The mechanism of social uniqueness is driven and regulated by the seven (7) forces which follow this proceeding order:

Competitions → Genetic selection → Physiological selection → Demographic selection →  
Psychosocial selection → Psychosocial fitness → Socio-demographic evolution

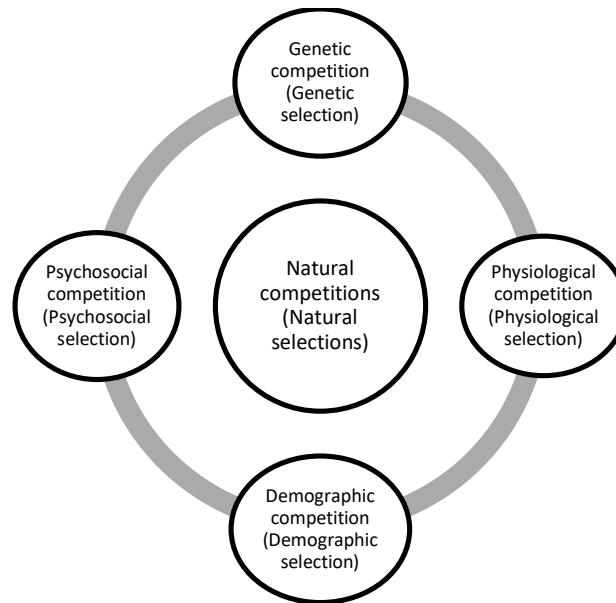

**4.1.1. Competition.** The competitions; whether genetic, physiological, demographic, and psychosocial; for the acquisition of genetic, physiological, demographic, and psychosocial advantages; is a principal force that creates different socio-demographic elements and drives genetic selection, physiological selection, demographic selection, and psychosocial selection toward psychosocial fitness and socio-demographic evolution (See Figure 9). For instance, competition for existence and survival creates different ages and life expectancies. Competition for educational positions and success creates different educational levels and requirements for admission and graduation. Competition for family (a mating partner) and territory creates different family values.

**4.1.2. Natural (biological) selection.** Competitions for genetic and physiological advancement, specialization, and advantages drive the idea of natural and biological selection. The biological environment is comprised of factors that favor an organism to outcompete the genetic chance and the physiological regulatory requirements. The desirable traits acquired together with an optimum physiological state accelerate the development and proper functioning of body organs and hormonal and nervous coordination

## Socio-Demographic Statuses

which influences behaviors, cognitive responses, and adaptive potentials of the organism. Naturally selected organisms would tend to grow and develop faster with a high sense of maturation, adaptation, and behaviors. Together with the cognitive responses would help him/her to pass the requirements of social and psychological environments.

**Figure 9:** Continuum of competitions as a driving forces of natural competitions and selections.

**4.1.2.1. Genetic selection.** Competition for desired alleles, genes, traits, gametes, and beneficial mutations necessitates sexual selection and mating structure, genetic drift, and genetic purity (free from harmful mutations). Outcompeted individuals are naturally selected.

**4.1.2.2. Physiological selection.** Competition for hormonal and nervous coordination and adaptation (for accelerated development, maturation, cognitive responses, and neural mechanisms) necessitates the acquisition of desirable genetic traits and biological requirements. Outcompeted individuals are naturally selected.

**4.1.3. Demographic selection.** Competition for existence and survival necessitates the freedom of fundamental rights, healthy lifestyles, immunity, defensive and adaptive mechanisms, nutrition, and parental care. The outcompeted individual(s) are naturally selected and favored by good social, political, economic, and religious policies of their immediate environment.

**4.1.4 Psychosocial selection.** Competition to satisfy, adopt, and tolerate the social and psychological requirements and challenges in different social environments (e.g educational, occupational, and family structures) creates the issue of psychosocial selection. For instance, (a) competition for the highest academic and educational positions and advantages necessitates the requirement of maturation and cognitive responses. The outcompeted individuals are those with the highest commitment, dedication, good personalities, cognitive creativity, and constructiveness; (b) competition for the highest occupational positions and advantages necessitates the requirement of maturation, cognitive responses, education or skills, commitments, dedication, and good personalities. The outcompeted individuals are those with the highest creativity and constructiveness; (c) competition for the mating partner(s) and happy family necessitates the requirement of maturation, cognitive responses, education, skills, occupation, commitments, dedication, good personalities, and desirable social and biological traits. The achievement and success remain variable to the value system.

Note that, the idea of social materialism arose due to reaching certain positions and successes through occupational advantages (such as incomes, turnover, salaries, wages, etc). The more occupationally

## Socio-Demographic Statuses

successful an individual has become, the more the chances he/she has to acquire and possesses a relative degree or amount of material objects and wealth (such as assets and liabilities).

**4.1.5 Psychosocial fitness.** His/her ability to perform to the desired requirements and expectations of social and psychological environments scale him/her to acquire a diverse range of social advantages, positions with the highest speed, and successes.

**4.1.6. Socio-demographic uniqueness and evolution.** This is the highest stage every individual is striving to attain, achieve, maintain, update, and upgrade. Socio-demographic uniqueness is the last stage of the proceeding factors. Uniqueness emerges when an individual(s) is socio-demographically distinctive and distinguished from others. Over time, the accumulation of such individuals would transform the social environment into a new distinct, and unique population.

## 4.2. Second Theoretical Assumption.

It states that the socio-demographic statuses (positions and successes) of an individual(s) in a population remains socio-demographically dynamic provided that there is population growth, a continuum of competitions, genetic selection, physiological selection, demographic selection, psychosocial selection, migration, and immigration.

Population growth ensures the continued existence of a socially dynamic population of individuals; Migration exposes, transforms, update, and upgrades the individuals with new genetic and social traits; Immigration introduces new genetic and social traits into the social population.

## 5. Evolutionary Transitions of Socio-demographic Hierarchy

This section describes the different evolved socio-demographic hierarchy of individuals in a population. It presents and clarifies our understanding of the social hierarchy and the analytical basis for its establishment (See Table S1-S3 of the supplementary material here attached to this manuscript).

Suppose we consider the general approach of socio-demographic analysis (socio-demographic position and socio-demographic success) as demonstrated in Figure 1 or 2 and Figure 3 or 4 to establish a common socio-demographic hierarchy in a population of female (or male) individuals. We can identify the following hierarchical structure (See Figure 10 and Table S1-S3 of the supplementary material here attached with this manuscript): two (2) socio-demographic kingdoms (feminine and masculine kingdom), within each socio-demographic kingdom with three (3) socio-demographic clades (first, second and third clades), within each socio-demographic clade with three (3) socio-demographic groups (upper, middle and lower groups), within each socio-demographic group with four (4) socio-demographic classes (class 1 to 4), within each socio-demographic class with four (4) socio-demographic orders (order 1 to 4), within each socio-demographic order with four (4) socio-demographic grades (grade 1 to 4).

Socio-Demographic Statuses

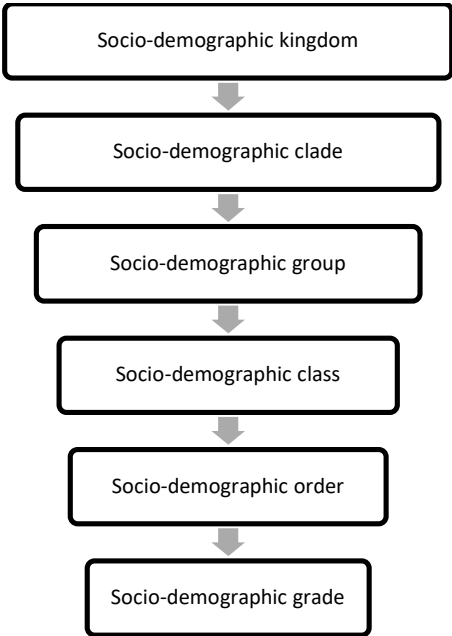

Figure 10: Socio-demographic hierarchies.

**5.1. Socio-demographic kingdoms.** It is the first rank of the socio-demographic hierarchy. It connects all age individual males and females irrespective of their educational, occupational attainments, and family acquisition. The main reason of their interaction is the shared biological sex. Based on biological sex differences, a socio-demographic kingdom is categorized as a feminine kingdom and masculine kingdom comprising of all female and male individuals respectively.

**5.2. Socio-demographic clades.** It is the second rank of the socio-demographic hierarchy. It connects all female or male individuals of all ages irrespective of their educational, occupational attainments, and family acquisition. The main central goal of their interaction is the shared completion of existence and survival. A socio-demographic clade is seen in three categories as follows:

**5.2.1. Third clade (third triage).** This socio-demographic clade comprised of adult individuals of all ages that share a common but relatively different intensity of competing for social advantages. The clade members mostly share common social click and struggle to attain, acquire, maintain, update, and upgrade their social positions and successes (such as education, occupation, and family). Although they live in the same social niches and may have differences in socio-demographic success, usually structured themselves into distinct socio-demographic groups based on age (age-mates) as third clade upper group (late aged adults), third clade middle group (middle-aged adults), and third clade lower group (early aged adults). For evidence of analytical representation and hierarchical demonstration, refer to appendix I.

**5.2.1.1. Third clade upper group.** Comprised of later aged adult individuals with usually high completion to maintain specific social positions and advantages (Table 1). Similar to the first triage middle and lower groups, the group members usually dissociate themselves into distinct socio-demographic classes, from class 1 to 4. One socio-demographic class differs from the other based on the level of acquired education. Within each socio-demographic class, another distinction can be formed into different socio-demographic orders based on the occupational scale. And with each socio-demographic order are other categories into different socio-demographic grades based on marital status.

## Socio-Demographic Statuses

**Table 1:** Example of some features common among almost all individuals of the third clade upper group.

Characteristics	Class 1	Class 2	Class 3	Class 4
• Level of education	Tertiary	Secondary	Basic	None
• Struggle to maintain self and family status	✓	✓	✓	✓
• Loss of job (or retirement)	✓	✓	✓	✓
• Low income	✓	✓	✓	✓
• Loss of family	✓	✓	✓	✓
• Physical and mental degeneration	✓	✓	✓	✓
• Medical complications	✓	✓	✓	✓
• Menopause (for women)	✓	✓	✓	✓

**5.2.1.2. Third clade middle group.** Comprise of middle-aged adult individuals with usually high completions to update/upgrade specific social positions and advantages with usually almost the same challenges (Table 2). Similar to first triage upper and lower groups, the group members usually dissociate themselves into distinct socio-demographic classes, from class 1 to 4. One socio-demographic class differs from the other based on the level of acquired education. Within each socio-demographic class, another distinction can be formed into different socio-demographic orders based on the occupational scale. And with each socio-demographic order are other categories into different socio-demographic grades based on marital status.

**Table 2:** Example of some features common among almost all individuals of the third clade middle group.

Characteristics	Class 1	Class 2	Class 3	Class 4
• Level of education	Tertiary	Secondary	Basic	None
• Struggle to update/upgrade self and family status	✓	✓	✓	✓
• Struggle for job promotions, expansion or diversification of skills	✓	✓	✓	✓
• Struggle for more income	✓	✓	✓	✓
• Stability of income	✓	✓	✓	✓
• Physical and mental stress	✓	✓	✓	✓

**5.2.1.3. Third clade lower group.** Comprise of early aged adult individuals with usually high completions to attain a certain level of social positions and advantages and end at almost with the same challenges (Table 3). Similar to first triage upper and middle groups, the group members also usually dissociate themselves into distinct socio-demographic classes, from class 1 to 4. One socio-demographic class differs from the other based on the level of acquired education. Within each socio-demographic class, another distinction can be formed into different socio-demographic orders based on the occupational scale. And with each socio-demographic order are other categories into different socio-demographic grades based on marital status.

**Table 3:** Example of some features common among almost all individuals of third clade lower group.

Characteristics	Class 1	Class 2	Class 3	Class 4
• Level of education	Tertiary	Secondary	Basic	None
• Struggle to attain a certain level of self and family status	✓	✓	✓	✓
• Struggle for Job/skill acquisition	✓	✓	✓	✓
• Struggle for income	✓	✓	✓	✓
• Instability of income	✓	✓	✓	✓
• Physical and mental stress	✓	✓	✓	✓

## Socio-Demographic Statuses

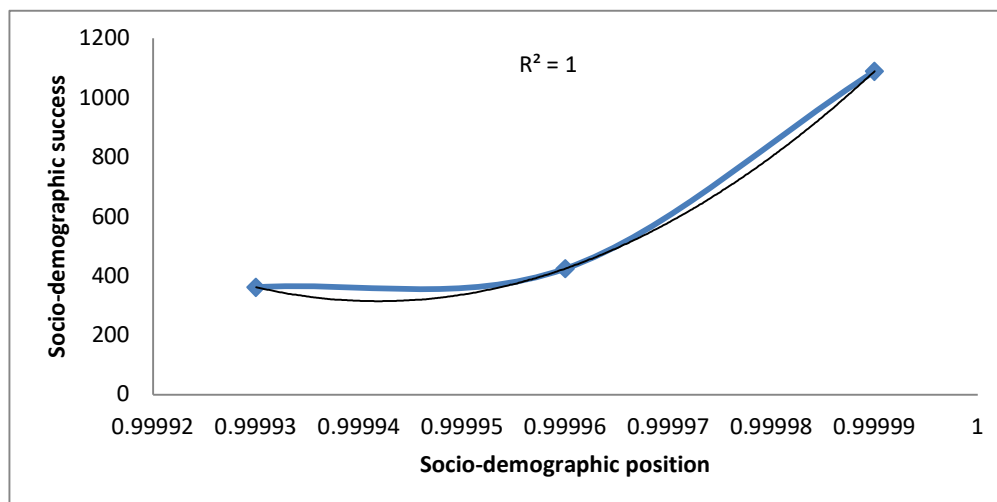

**5.2.2. Second clade (second triage).** This socio-demographic clade is comprised of adolescent individuals that share common competing social advantages and have almost the same social challenges. The group members mostly share common social clicks and struggle to acquire and attain an educational status and skill. Adaptation and tolerance to social challenges represent the major common problems for most adolescents. At this point they recognize themselves as a unique socio-demographic group, obtain called classmates into second clade upper group (tertiary school classmates), second clade middle group (secondary school classmates), and second clade lower group (primary or elementary school classmates). In our recent socio-demographic transition, members of this clade, usually start competing for occupation or skills, but rarely competes for family. For evidence of analytical representation and hierarchical demonstration, refer to appendix II.

**5.2.3. First clade (first triage).** This socio-demographic group is comprised of child individuals that share a common competing biological and demographic advantage and have almost the same challenges. The group members mostly share a common social playground and struggle to acquire and attain a certain sensory (ability: to recognize their environment, to hear, to feel, etc) and nervous (ability: to walk, to speak, to learn and comprehend, to feed by him/herself, and to become independent) responses. Unless there was any genetic abnormality or error, the physiology would represent no challenge to them. However, the likely challenge they may face is the competition of their demographic environment (existence and survival). At this point they recognize themselves as a unique group, obtain as age mates. In our recent socio-demographic transition, members of this clade neither compete for occupation nor family. For evidence of analytical representation and hierarchical demonstration, refer to appendix III.

## 6. Population Socio-demographics

Population socio-demographics describe the relationship that exists between individuals, or groups of individuals and their attained socio-demographic positions or successes in a given population over a given period. It also defines the distribution of individuals based on their socio-demographic statuses in the general or specific or defined population (e.g socio-demographic statuses of smokers, drug adductors, criminals, HIV infected patients, hypertensive patients, etc).

The results in figure 11 explained the graphic relationship between socio-demographic position and success. The result shows that socio-demographic position correlates polynomially ( $r^2 = 1$ ) with socio-demographic success within each socio-demographic order of a given socio-demographic hierarchy (Refer to Appendices).

**Figure 11:** Correlation between socio-demographic position and success.

## Socio-Demographic Statuses

### 7. Application of socio-demography of statuses

**7.1. Population census.** The socio-demographic statuses of individuals in a population can be a helpful guide for sorting and estimation the frequency of population individuals with particular or specified demographic or sociological characteristics. It can also be used to show the distribution of people concerning a certain demographic or sociological attributes.

**7.2. Candidates screening.** Socio-demographic statuses of applicants can be a simplified approach of sorting individuals with a set of specified demographic and/or sociological attributes of organizational interest. This method could save time scanning, screening, and sorting of individuals that have acquired or attain a defined and desired demographic and sociological characteristic.

**7.3. Medical research and investigations.** The socio-demographic statuses of clients or patients can be of immense importance in medical research and investigations. The relationship between a disease or disorder and patients' demographic and/or sociological states can be traced and correlated. For instance, the socio-demographic statuses of HIV, diabetes, hypertensive, etc can be understood more efficiently.

**7.4. Socio-demographic stratification.** The socio-demographic hierarchy presented in this article can be a more advanced approach over the social hierarchy developed by Karl (1959) and Max (1921/2015) which was based on only one or two social attributes such as power, prestige, productivity, or materialism.

**7.5. Personnel evaluation and promotions.** Socio-demographic position and success of employees can be a helpful guide for their evaluation, promotion, and retirement based on the assessment criteria established by the organization.

**7.6. Profile simplifications.** The socio-demographic statuses of individuals can be a summarized characteristic (profile) of his/her demographic and sociological attainments and achievements. Socio-demographic configuration and score of an individual present him/her secured figures or codes describing his/her demographic and social identity.

**7.7. Organizational ranking.** Socio-demographic statuses can be used to measure the organizational impact and its personnel's potentialities and strength. This can help as a factor in an organizational ranking such as institutional ranking or professional bodies.

**7.8. A measure of socio-demographic or socio-economic development.** Socio-demographic configurations and scores of individuals in a given geographical location, ethnicity, country, etc can be an index of socio-demographic or socio-economic development.

**7.9. Personal values structure.** The personal values structure of a given socio-demographic population can be understood. This can greatly help in policy-making and targeting the socio-demography of individuals with given personal values.

### 8. Methodological Innovations

This article is methodologically innovative in the following issues:

- i. It empirically defines what scientists means by socio-demographic of statuses of an individual(s) in a population. This is among the first attempt to provide such a more detail explanations.
- ii. It presents methods for the analytical measures of socio-demographic statuses (socio-demographic position and success) of individual(s) in a population. The socio-demographic attributes are compressed (analyzed) into numerical codes or values (i.e. the socio-demographic configurations and scores) rather than each measured socio-demographic attribute is defined separately. This is among the first attempt to express such analytical measures.
- iii. It proposes theoretical assumptions for the evolution of socio-demographically unique population of individuals. This is among the first attempt to explore these related theories.

## Socio-Demographic Statuses

**9. Conclusion**

Socio-demographics describe the relationship that exists between individuals, or groups of individuals and their attained socio-demographic statuses (socio-demographic positions and successes) in a given population over a given period. Socio-demographic statuses are common, universal, and desirable positions, achievements, and advantages every individual strives and competes to attain, achieve, maintain, and upgrade which are influenced by the biological and social environments, driven and regulated by a continuum of competitions (through genetic competition, physiological competition, demographic competition, psychosocial competition) and selectively evolved through the mechanism of genetic selection, physiological selection, demographic selection, psychosocial selection, and resultant psychosocial fitness and socio-demographic evolution. Seven (7) factors (the driving forces) and eight (8) conditions responsible for the evolution of socio-demographically unique populations (transitions) were identified, and these evolutionary transitions were organized into six (6) socio-demographic ranks.

**10. Recommendations**

- a) The social and demographic constructs vary from population (societies) to population, and thus the elements of the socio-demographic attributes presented here may not apply to all societies. Therefore, the instrument to assess socio-demographic statuses of individuals of a given population need to be carefully selected and validated.
- b) Empirical studies in the following aspect would provide a better understanding of the socio-demographic description of a population and may permit further decisions, policies, and actions.
  - i. Relationship between socio-demographic statuses and personal values.
  - ii. Relationship between socio-demographic statuses and personalities.
  - iii. Relationship between socio-demographic statuses and physical/mental diseases or disorders.
  - iv. Relationship between socio-demographic statuses and geographical locations.
  - v. Relationship between socio-demographic statuses and ethnicities.
  - vi. Relationship between socio-demographic statuses and races.
  - vii. Relationship between socio-demographic statuses and religiosity.
  - viii. Relationship between socio-demographic statuses and social power or prestige.
  - ix. Relationship between socio-demographic statuses and social dominance.
  - x. Relationship between socio-demographic statuses and materialism.
  - xi. Relationship between socio-demographic statuses and criminalities.
  - xii. Relationship between socio-demographic statuses and mortality rate.
  - xiii. Relationship between socio-demographic statuses and healthy lifestyle.
  - xiv. Relationship between socio-demographic statuses and unhealthy lifestyle.
