11 Abstract: Background: We conducted research on the newly developed personalized 12 recommendation service (PRS) of the global network of Korean scientists and engineers (KOSEN) 13 in order to explore the information usage behavior and importance of the PRS used by Korean 14 scientists and engineers. Methods: In order to understand information usage behavior, we gathered 15 data from 513 survey results and analyzed them in terms of information usage behavior and the 16 corresponding importance in each of the service quality areas. Results: We analyzed the 321 17 outcomes that indicated non-use of the PRS in order to understand the underlying reason(s); we 18 employed 192 results that demonstrated the use of functionality to examine information usage 19 behavior and importance. They found that the predominant motive for non-use of the service 20 resulted from the respondents not knowing how to use it. According to demographic characteristics, 21 the usage behavior of the PRS showed a difference regarding the purpose of using the service in the 22 categories of gender and major field of study. Furthermore, users were concerned with various 23 components of the PRS such as ease of use, design, relevance of content, user support, and 24 interactivity. Conclusions: We suggest reinforcing user education degree and promotion to enhance 25 the PRS. Since users were concerned with ease of use, design, relevance, user support, and 26 interactivity, we recommend these as major points for improvement.

- 27 Keywords: personalized recommendation service; usage behavior; KOSEN
- 28

29 1. Introduction

30 1.1. Background and purpose of the research

31 As information is produced, reproduced and expanded exponentially, users are able to obtain it 32 through a variety of routes, but their exposure to an excessive amount of material poses a challenge 33 to acquiring the knowledge they desire, and they waste a lot of time accessing content that does not 34 meet their needs. Korean online service providers of academic, scientific information offer limited 35 functions that categorize research results in various forms and aggregate them from different fields 36 of study, but only in terms of the date published. This technological hindrance demands time and 37 effort from users when acquiring the facts they want, since they have to use approaches (such as 38 filtering) to extract the appropriate information from the vast amount of data available. This problem 39 also causes past research that a user in a specific field might find relevant to be buried under more 40 recent knowledge. The authors of this study researched a personalized recommendation service 41 (PRS), which overcomes the abovementioned obstacles and provides users with sufficient 42 information. Since March of 2017, the Global Network of Korean Scientists and Engineers (KOSEN, 43 www.kosen21.org), an academic science information platform that is the focus of this study, has 44 operated a PRS based on big data; it automatically provides users with appropriate service menus 45 and content based on their individual characteristics. The authors investigated the information usage

- behavior of people who use KOSEN's PRS and analyzed the outcomes based on quality of service,thereby proposing a method to improve the system.
- This study allows the system to be enhanced in a way that boosts the quality of service and reduces the time users need to acquire pertinent knowledge. Furthermore, it helps to prolong the lifecycle of valuable information by identifying older data that could apply to users in their respective fields, but which do not appear at the top of the search results. Chapter 2 examines the theoretical background of the PRS and the existing literature. Chapter 3 introduces the research on and analysis of user information behavior, while Chapter 4 deduces the implications and points of improvement, based on the outcomes of Chapter 3. The conclusion reviews the significance of this study and
- 55 suggests directions for future research.
- 56 1.2. *Objective of the research*

57 This study analyzes the current state of use, as well as the usage trends of, Korean scientists and 58 engineers who access the PRS, the goal being to understand their information usage behavior and 59 satisfaction rate. In terms of usage trends, the authors examined the effects of users' demographic 60 traits (age, gender, education level, major, and occupation) on such trends in addition to awareness, 61 satisfaction rate, expectations, and the correlations among these components.

- RQ1. Do the usage behaviors of PRS users show variance according to their demographiccharacteristics?
- 64 RQ2. Does the satisfaction rate for the service's three areas of quality (system, content, and 65 service support) show variance according to users' demographic features?
- RQ3. What are some priorities and key concerns of users regarding the service, and is there asignificant correlation among the three areas of quality pertaining to them?
- 68

69 2. Theoretical framework

70 2.1. Existing literature

The research on the PRS in the field of library and information science is scarce, both in Korea and abroad. This may be due to a lack of research on the PRS (for academic information) in this field of study. Existing pieces of literature relevant to the present study include those pertaining to science and

74 technology researchers' information usage behavior, the PRS, and users' satisfaction rate with it.

75 2.1.1. The information behavior of scientists and engineers

76 The research on the information behavior of scientists and engineers can be classified broadly into 77 that of scientists and engineers, undergraduate students, and graduate-students.

78 Brown (1999)[6] used a survey to analyze the information search behavior of astronomers, 79 chemists, mathematicians, and physicists at Oklahoma University. The results revealed that scientists 80 and engineers rely heavily on academic journals to support their investigations and creative activities. 81 An interesting observation was that despite the demand for more information services, most of the 82 researchers preferred to approach them via published - rather than electronic - media. Majid et al. 83 (2000) [9] asserted that the information knowledge and seeking behavior of scientists and engineers 84 plays an important role in efficiently satisfying information requests, and suggested that libraries could 85 use this knowledge to re-arrange their collections and facilities according to the requests of the scientific 86 community. Furthermore, their findings illustrate that scientists and engineers prefer major information 87 sources, especially journals and review articles.

To develop and assess a medical information system that reflects the information seeking behavior of doctors, Kim (2016)[43] carried out in-depth interviews with doctors on their information usage behavior in order to develop a knowledgeable source that could adequately fulfill their information requests; the results were reflected in a search system called MediSearching. The interview outcomes showed a difference in information usage behavior according to type of hospital or area of specialization. Whereas doctors at university hospitals had a large amount of information requests for

3 of 21

94 research and used academic journals as their predominant means of obtaining data, doctors at private 95 and special hospitals mostly received requests in terms of medical treatment, and satisfied their needs

96 by having conversations with their fellow physicians.

97 In his research on the information usage behavior of science and engineering students at the 98 undergraduate and graduate levels, Fidzani (1998)[8] studied the information seeking behavior and 99 usage of information resources by graduate students at the University of Botswana. His overall 100 objective was to identify requests and understand students' degree of awareness regarding library 101 services. He collected the experiential date on the graduate students' information requests, and 102 observed that a guideline for utilizing library resources and services was necessary in order to meet 103 some of the requests.

Lee (2016)[44] studied the entire processes of an information service with the actual users as the subjects in order to acquire the basic data to develop a service based on the users' traits and requests, the goal being to revitalize university library information services. The outcomes indicated that critical components of an effective service include the user's information and an analysis of the themes, successful consultation, communication techniques, and the information provider's awareness and ability.

110 2.1.2. The PRS and relevant studies

Yoo (2017)[45] defined a recommendation system as a service that utilizes a user's information or the content to select and present content that may be relevant to him/her, thereby reducing the user's effort in looking for pertinent data from the vast amount of material available. The R&D of the PRS began in the late 1990s, starting with the filtering technique, which was used for news and webpages. Recommendation techniques have become increasingly refined and sophisticated since the 2016 competition hosted by the American company Netflix. Research on increasing the relevance of recommendations and the efficacy of services is ongoing.

118 Research on recommendation techniques has a relatively long history. The most prominent 119 methods include demographic recommendations, content-based filtering, collaborative filtering, and 120 hybrid filtering (which combines two approaches that complement the other's limitations) (Jung and 121 Lee, 2005).[14] Content recommendation systems primarily use content-based recommendation 122 algorithms, as well as collaborative filtering algorithms. Since recommendation techniques that employ 123 collaborative filtering showed significantly superior outcomes in terms of accuracy compared to those 124 with content-based filtering in the Netflix competition, the most recent studies have focused on the 125 former.

Personalization is a broad concept used to signify providing data that corresponds to information requested by the user. Personalization can be classified as passive and active. The former offers the user relevant information or products based on his/her profile during the process of the information search that he/she has designated. It is primarily explored in information searches on word ambiguity and similar topics. Regarding the latter type, the service provider offers the user pertinent information based on his/her profile, which reflects his/her preferences as new data becomes available, before the user makes a request. It can be categorized as a PRS and is mainly studied in data mining (Kim, 2002). [12]

133 In his investigation of computer science, Kim, B.M. et al. (2004)[11] stated that information filtering 134 can be classified into content-based and collaborate filtering techniques, and that the former uses 135 information from content, whereas the latter employs the opinions of other users. He focused on the 136 organic integration of both approaches in order to overcome the constraints of collaborative filtering, 137 and proposed a method that uses its framework and enforces it with an improved usage of user profiles. 138 Koh et al. (2017)[46] designed a smart mirror that uses IoT for a user personalization service. The smart 139 mirror harnesses information on the Internet to provide users with real-time traffic data, news, 140 schedules, and weather updates. It can also offer recommendation services by employing a user's usage 141 history.

142 In the field of library and information science, Kim (2006)[47] investigated a hybrid 143 recommendation system for multimedia content based on frequency of use, and proposed a system that 144 provides users with personalized multimedia content (as an active information service in libraries and

4 of 21

145 information centers). He analyzed the pros and cons of conventional recommendation techniques. To

- solve their shortcomings, he put forward a hybrid recommendation system that employs the user's frequency of use of content in a high-volume content environment. Park (2016)[48] suggested book
- frequency of use of content in a high-volume content environment. Park (2016)[48] suggested book curation as an information service that a school library webpage could offer, and derived the criteria
- 148 curation as an information service that a school library webpage could offer, and derived the criteria 149 for the curation, which are needed to design the system. In order to derive twelve criteria for
- for the curation, which are needed to design the system. In order to derive twelve criteria for recommendations, he examined a list of suggested books in a pre-existing system, and analyzed

151 properties in the user information, as well as book information that could be used for the

- recommendation service. A survey that looked at users' preferences for each of the criteria showed that
- 153 most students believed that libraries need book curation services.
- 154 2.1.3. The satisfaction rate of information service users

155 Investigations pertaining to user satisfaction comprise an active field in terms of academic 156 research, which is dealt with in various fields of study. The following is a survey of relevant studies to 157 this paper's theme and pertains to user satisfaction in the field of the library information provision or 158 academic information service.

159 Martensen and Gronholdt (2003)[28] described the development and application of a model that 160 enables librarians to quantitatively measure quality, satisfaction rate, and user loyalty, and examined 161 the degree to which collection, service, and environment affect the aforementioned elements.

162 Khan and Shafique (2011)[27] examined the role and importance of departmental libraries in 163 satisfying students' information requests. They assessed the satisfaction rate of users of departmental 164 library services; the outcomes showed that most of the surveyees were satisfied with virtually all of the 165 services provided by the departmental libraries. Furthermore, most of the surveyees requested more 166 computers, digital collections, magazines, and newspapers from departmental libraries.

Seeholzer and Salem (2011)[26] examined expectations and satisfaction rates at Kent State University's library website by focusing on both groups and individuals. The participants interacted with the library's resources and services using a mobile website to a degree that surpassed expectations. The results revealed that the participants were employing the mobile website to use the research-related database, library catalogues, and reference system; they were also interested in contacting the library using text messages.

An analysis of the relevant research on the information behavior of scientists and engineers, the PRS, and user satisfaction with information services indicates a need to periodically investigate users' information requests, as well as to evaluate the collection and service usability of the science technology information service. This study examines the information usage behavior of users of KOSEN's PRS in order, and proposes improvements to the system based on the findings.

178 2.2. Overview of KOSEN and PRS

179 2.2.1. Overview of the KOSEN (The global network of Korean scientists and engineers)

180 KOSEN, an academic science information platform that is the subject of this study, was created as 181 part of the Internationalization Foundation Construction Project by the Ministry of Science and 182 Technology in order to connect Korean scientists and engineers dispersed throughout the globe in 183 cyberspace. Korean scientists and engineers abroad can obtain news from science and engineering 184 circles in Korea through KOSEN, and can contribute to their development by providing advanced 185 information from overseas. Moreover, scientists and engineers in Korea can acquire such data promptly 186 and establish a network that enables multi-dimensional exchanges, such as meeting prospective 187 partners for international joint research. Individual scientists and engineers can use the information 188 they find in KOSEN to enhance their own competence, the accumulation of which contributes to the 189 capacity of Korea's national science and engineering society. With these goals in mind, KOSEN 190 launched its website in July 1999. As of December 2017, it has 130,000 active members. Since March of 191 2017, KOSEN has operated a PRS in-house based on big data that automatically provides users with 192 relevant service menus and content based on their individual characteristics.

- 199 **Figure 1.** Item of KOSEN web Page.
- 200

201 1. Widget Service: A total of 14 service menus including messages, document folder, "My articles,"
202 and "My café." The information pertaining to each service is provided at the time of login, and the user
203 is notified of new articles and related information at the time of posting.

204 2. Recommendation List Service: Provided after personalization is applied and after logging in.
205 Information from nine menus (laboratory information, academy information, business announcements,
206 KOSEN reports, trend reports, knowledge and sentiments forum, What is?, career opportunities,
207 analysis requests) is provided based on the most frequently accessed services in the user group to which
208 the user belongs.

6 of 21

3. Scheduler: Associates users with similar characteristics to derive preferred services of user
 groups to announce academy information, business announcements, career opportunities, and KOSEN
 timetables and events.

4. Card Service: Provided after personalization is applied and after logging in. Information from 11 menus (global news, knowledge curator, videos, overseas business trip support, overseas enterprises, KOSEN webzine, current affairs and discussions, infographics, Korean community events, activities, press releases), selected based on the services accessed most frequently in the user group to which the user belongs, are provided in card format.

5. Image Service: This service constitutes 17 service menus that the administrator recommends in order to encourage users to utilize the services. The services recommended to login and non-login members are differentiated by the administrator settings.

6. Personalization Service Settings: User login activates the function to add a service in which the
user is interested to the PRS tab. Users can add or change services in which they are interested by
adjusting the settings.

223

224 3. Research and analysis of user's information usage behavior

225 3.1. Design of the research instrument

| Measured areas | | Measured indicators | No. of questions | Remarks |
|--|--|---|------------------|----------------------------|
| | 1. Demographic characteristics | Age Sex Educational attainment Major Occupation | 5 | Kang (2008), Nam (2010) |
| User characteristics | 2. Usage behavior of personalized recommendatio n service | Whether to use personalized recommendation service Reason for non-use Primary purpose of using it Number of visits Service usage time | 5 | Kang (2008), Nam (2010) |
| | 1. System (website) | Design Ease of use Accessibility | 3 | Kang (2008) |
| Personalized recommendation service quality | 2. Content | Adequacy Sufficiency Utility | 3 | Nam (2010), Lee (2017) |
| | 3. Service support | User support Interactivity | 2 | Kang (2008), Nam (2010) |
| Personalized recommendation service importance | 1. Importance for each personalized recommendation service area | | 1 | Nam (2010) |

Table 1. Composition of the questionnaire

227

As shown in Table 1, the survey questions – which were designed to assess the information usage behavior of KOSEN users – consist of 20 questions in the three areas of (1) user characteristics,

7 of 21

(2) PRS quality, and (3) PRS importance. The first dimension consists of ten questions under two
categories designed to assess users' traits and PRS usage behavior. The second area comprises nine
questions under three categories designed to assess the system (homepage), content, and service
support. Third, PRS importance consists of one question designed to understand the elements of the
PRS that the user deems to be important. The questionnaire for evaluating PRS quality and PRS
Importance used a five-point assessment system.

236 3.2. Research subjects and methodology

KOSEN users were selected as the research subjects. Although some KOSEN users do not use
the PRS, the reasons for non-use are accounted for in Chapter 4, which discusses methods for
improving the service.

To investigate the information usage behavior of KOSEN's PRS, the authors sent online surveys to KOSEN users who consented to receiving e-mail communication. The authors gathered data for two weeks from March 6th to March 14th, 2018 utilizing Google Docs. A total of 513 users responded; the authors analyzed the data from the 321 users who do not use the service as well as the 192 users who do.

The authors employed SPSS 23.0 to analyze the data. The steps of analysis were as follows: (1) The authors performed factor analysis and reliability tests on the survey questions, which served as the instrument of measurement. Secondly, the authors analyzed user behavior, overall satisfaction rate, the basic statistical data from the assessment of the quality of service, and basic statistical data on importance. Thirdly, the authors conducted a t-test and ANOVA to examine the overall satisfaction rate per different categories such as gender, education level, and major field of study.

- Lastly, the authors conducted correlation analysis to investigate the correlation between system, content, service support, and overall satisfaction rate. They also performed multicenter retrospective analysis to explore the degree of influence.
- 254 3.2. Research subjects and methodology

255 3.2.1. Factorial and reliability analysis of the measurement instrument

In order to assess the reliability of the collected data, the authors used Cronbach's alpha coefficient to analyze the internal consistency reliability of the survey questions. Table 2 shows the results of the reliability assessment.

259

| Area and number of items | Factor | Cronbach's alpha |
|--------------------------|---------------|------------------|
| (Letters (2)) | Ease of use | .750 |
| System (3) | Design | .863 |
| | Sufficiency | .794 |
| Content (3) | Adequacy | .744 |
| Sorrigo gumport (2) | User support | .861 |
| Service support (2) | Interactivity | .810 |

260 **Table 2.** Internal consistency reliability analysis of the independent variables

261

266 rubic 2. Internal consistency remainity analysis of the independent variables

Using the factor analysis, the authors grouped the three system components, the three content components, and the two service support components in order to simplify the variables. They conducted factor rotation using Verimax rotation (which is an orthogonal rotation), as well as the

265 Kaiser-Meyer-Olkin (KMO) test and Bartlett's test of sphericity. A KMO of 0.7 showed that the

outcome was adequate. Since the KMO value was 0.839, the authors deemed the research request to be adequate. Next, in the test to verify whether Bartlett's factor analysis would be sufficient, the value obtained was significantly smaller than 0.95, which indicates that the use of factorial analysis was appropriate. The results of the factor analysis showed that there were two service support components: user support and interactivity.

271 Cronbach's alpha tests reliability by testing the probability of obtaining the same value when 272 the measurement is conducted again for the same concept. In academic papers, a value greater than 273 0.6 conventionally guarantees reliability. Thus, the internal consistency reliability has been 274 guaranteed. In terms of the system components, ease of use has a reliability value of 0.750, 275 demonstrating a normal level of reliability. Design has a reliability value of 0.863, indicating a high 276 level of reliability. Lastly, accessibility has a reliability value of 0.765, which signals a normal level of 277 reliability. In terms of the content components, sufficiency has a reliability value of 0.794, revealing a 278 normal level of reliability. Adequacy has a reliability value of 0.744, which reflects a normal level of 279 reliability. Lastly, utility has a reliability value of 1.000, displaying a very high level of reliability. 280 Third, for service support components, user support has a reliability value of 0.861, indicating a high 281 level of reliability. Lastly, interactivity has a reliability value of 0.810, which suggests a high level of 282 reliability.

Furthermore, the authors conducted descriptive statistical analysis to obtain the descriptive statistical values of the variables.

| | Ν | Min | Max | Mean | Standard deviation | Skewness | Kurtosis |
|---------------|-----|-----|-----|------|--------------------|----------|----------|
| Ease of use | 192 | 1 | 5 | 3.72 | .786 | 378 | .675 |
| Design | 192 | 1 | 5 | 3.58 | .828 | 252 | .155 |
| Accessibility | 192 | 1 | 5 | 3.54 | .734 | .157 | .319 |
| Sufficiency | 192 | 1 | 5 | 3.71 | .768 | 366 | .705 |
| Adequacy | 192 | 1 | 5 | 3.85 | .739 | 471 | .518 |
| Utility | 192 | 1 | 5 | 3.51 | 1.008 | 309 | 313 |
| User support | 192 | 1 | 5 | 3.41 | .818 | .028 | 190 |
| Interactivity | 192 | 1 | 5 | 3.60 | .766 | 196 | .244 |
| Importance | 192 | 1 | 5 | 3.92 | .712 | 203 | 627 |

285

Table 3. Result of the descriptive statistics

287

288 3.2.2. Basic statistical analysis

The authors employed basic statistical analysis to investigate the characteristics of the surveyees, their usage behavior of the PRS, and reason(s) for non-use in order to understand the overall usage trends of the service users. The investigation of the characteristics included demographic components such as age, gender, education level, major field of study, and occupation. The outcomes are shown in Table 4.

- 294
- 295

| variables | Items | frequency | % |

Table 4. Demographic characteristics

297

According to Table 4, in terms of age, 7.3% of (or 14) users were in their 20s, 31.3% (60) were in their 30s, 36.5% (70) were in their 40s, and 17.7% (14) were in their 60s. In terms of gender, 87.5% were male (168) and 12.5% were female (24). Regarding education level, undergraduates comprised 18.2%

301 (35), while graduates made up 27.6% (53) and doctors 54.2% (104). In terms of major field of study,

10 of 21

- 302 2.6% of (or 5) users majored in construction/transportation; 5.2% (10) in science and technology and 303 humanities and the social sciences; 7.8% (15) in mechanical engineering; 2.1% (4) in food, agriculture, 304 forestry and fisheries sciences; 0.0% (0) in brain science; 2.1% (4) in physics; 8.3% (16) in healthcare; 305 22.4% (43) in life science; 0.5% (1) in mathematics; 2.1% (4) in energy and resources; 0.0% (0) in atomic 306 energy; 1.6% (3) in cognitive-emotional science; 9.4% (18) in materials engineering; 6.3% (12) in 307 electrical and electronic engineering; 7.8% (15) in information and communication; 0.5% (1) in earth 308 science; and 6.8% (13) in chemical engineering. In terms of occupation, 41.7% of (or 80) users were 309 researchers, 8.3% (16) were students, 9.9% (19) were professors, 30.7% (59) were company employees, 310 while 9.4% (18) marked other.
- 311 3.2.3. Analysis of PRS usage behavior according to demographic characteristics
- The authors studied the following aspects of the surveyees' PRS usage behavior: use or non-use of the service, reason(s) for non-use, primary purpose of using the service, number of visits, and service use time. The results are shown in Table 5.
- 315

| Variable | Item | Frequency | % |
|-------------------------------------|---------------------------------------|-----------|------|
| Whether the user uses KOSEN's | Yes | 192 | 37.4 |
| personalized recommendation service | No | 321 | 62.6 |
| | Do not know how to use it | 258 | 80.6 |
| | Difficult to use | 8 | 2.5 |
| The reason for non-use of | Unnecessary | 35 | 10.9 |
| personalized recommendation service | Recommendation result is not adequate | 5 | 1.6 |
| | Others | 14 | 4.4 |
| | Information accessibility | 98 | 51.0 |
| | Adequate information | 46 | 24.0 |
| The primary reason for using | Useful information | 18 | 9.4 |
| personalized recommendation service | Variety of information provided | 28 | 14.6 |
| | Others | 2 | 1.0 |
| | 1-7 times a week | 123 | 64.1 |
| Number of visits to KOSEN service | 1-7 times a month | 50 | 26.0 |
| | 1-10 times a year | 19 | 9.9 |
| | No less than 1 hour | 158 | 82.3 |
| Service usage time | 1-2 hours | 31 | 16.1 |
| | 3 hours or longer | 3 | 1.6 |

- **Table 5.** Usage behavior of the PRS
- 317 318
- As for the question on whether the user is accessing KOSEN's PRS, 192 users answered "Yes"
- 319 (37.4%) and 321 users said "No" (62.6%).
- 320Regarding reason(s) for non-use, 258 users said that they "Do not know how to use it" (80.6%),3218 marked "Difficult to use" (2.5%), 35 stated "Unnecessary" (10.9%), 5 claimed the "Recommendation322results are not adequate" (1.6%) and 14 chose "Other" (4.4%). The fact that the predominant reason
- for non-use is "Do not know how to use it" suggests that company management needs to make
- 324 stronger efforts to promote user education.

Regarding the primary purpose of using the service, 51.0% of (or 98) users answered ("Information accessibility," 24.0% (46) chose "Adequate information," 9.4% (18) stated "Useful information," 14.6% (28) selected "Variety of information provided," and 1.0% (2) chose "Other."

In terms of the number of visits, 64.1% (123) answered "1–7 times a week," 26.0% (50) chose "1– 7 times a month", and 9.9% (19) selected "1–10 times a year." For service use time, 82.3% (158) marked "Less than 1 hour," 16.1% (31) stated "1–2 hours," and 1.6% chose "3 hours or more" (1.6%). The primary purpose of using the service was information accessibility, which enables users to access the information they desire rapidly. The second most chosen reason was to obtain relevant knowledge.

The authors conducted a cross-examination (chi-square) test to examine the variance in service usage behavior according to demographic characteristics. They investigated the differences in the primary purpose of using the service, the number of visits, and service use time.

336 First, regarding whether the purpose of using the service varies according to demographic traits, 337 gender and major field of study showed a statistically significant difference. Looking at gender, 54.2% 338 of males (91 users) selected "Information accessibility," 20.2% (34 users) chose "Adequate 339 information," 9.5% (16 users) marked "Useful information," 15.5% (26 users) answered "Variety of 340 information provided," and 0.6% (1 user) stated "Other." As for females, 29.2% (7 users) chose 341 "Information accessibility," 50.0% (12 users) selected "Adequate information," 8.3% (2 users) chose 342 "Useful information," 8.3% (2 users) answered "Variety of information provided," and 4.2% (1 user) 343 marked "Other." Looking at the verification statistics, x2 is 11.700 and the probability of significance 344 was 0.020, which indicates a statistically significant difference. Regarding field of study, by 345 examining the verification statistics, x2 is 86.887 and the probability of significance was 0.030, which 346 demonstrates a statistically significant difference. Age, education level, and occupation did not show 347 statistically significant differences.

348 Second, as for whether the number of visits varied according to demographic features, education 349 level showed a statistically significant difference. Among users with Bachelor's degrees, 48.6% (17 350 users) marked "1–7 times a week," 40.0% (14 users) chose "1–7 times a month," and 11.4% (4 users) 351 selected "1-10 times a year." Among users with Master's degrees, 54.7% (29) marked "1-7 times a 352 week," 24.5% (13) stated "1-7 times a month," and 20.8% (11) chose "1-10 times a year." Among 353 doctors, 74.0% (77) selected "1-7 times a week," 22.1% (23) chose "1-7 times a month," and 3.8% (4 354 users) answered "1-10 times a year." Looking at the verification statistics, x2 is 17.175 and the 355 probability of significance was 0.002, which suggests a statistically significant difference. Age, 356 gender, major field of study, and occupation did not show statistically significant differences.

Third, regarding whether service use time varied according to demographic elements, gender, age, education level, major field of study, and occupation all showed no statistically significant differences.

360 3.2.4. Demographic analysis of the satisfaction rate for system, content and service support

The three areas of PRS quality can be divided into system, content, and service support. Service can be classified under ease of use, design, and accessibility. Content can be categorized as sufficiency, adequacy, and utility. Service support can be broken down into user support and interactivity.

Table 6 shows the variance in the overall satisfaction rate for the areas of quality according to gender. The authors used a t-test to compare the genders, with the results showing that variance in

- 367 the overall satisfaction rate according to gender was marginal and therefore statistically insignificant.
- 368

| Variable | | Male | | | Б | |
|-------------|---------|--------------------|---------|--------------------|-------|------|
| | Average | Standard deviation | Average | Standard deviation | l | P |
| Ease of use | 3.76 | .781 | 3.44 | .771 | 1.923 | .056 |
| Design | 3.61 | .851 | 3.33 | .602 | 1.555 | .122 |

| Accessibility | 3.58 | .755 | 3.29 | .509 | 1.813 | .071 |
|---------------|------|------|------|-------|-------|------|
| Sufficiency | 3.74 | .787 | 3.50 | .590 | 1.407 | .161 |
| Adequacy | 3.88 | .751 | 3.63 | .612 | 1.575 | .117 |
| Utility | 3.54 | .996 | 3.29 | 1.083 | 1.110 | .268 |
| User support | 3.45 | .832 | 3.15 | .667 | 1.693 | .092 |
| Interactivity | 3.62 | .780 | 3.46 | .658 | .944 | .346 |
| Importance | 3.95 | .697 | 3.75 | .800 | 1.267 | .207 |

369 Table 6. Comparison of satisfaction by gender (t-test)

370 *p<0.05, **p<0.01

371

As with gender, the variance in the overall satisfaction rate according to age, education level, and occupation were also marginal and thus statistically insignificant. However, the ANOVA used to measure variance according to occupation produced a statistically significant variance, as shown in Table 7.

376

377 1. Regarding ease of use, the average for researchers (a) was 3.59; for students (b), 3.38; for
378 professors (c), 3.79; for company employees (d), 3.97; and for others (e), 3.78. The verification statistics
379 show the F value to be 2.966 and the significance probability to be 0.021. Hence, there is a statistically
380 significant variance in terms of ease of use.

2. Regarding design, the average for researchers (a) was 3.41; for students (b), 3.16; for professors
(c), 3.82; for company employees (d), 3.79; and for others (e), 3.75. The verification statistics show the
F value to be 3.557 and the significance probability to be 0.008. Therefore, there is a statistically
significant variance in terms of design.

385 3. Regarding accessibility, the average for researchers (a) was 3.44; for students (b), 3.06; for 386 professors (c), 3.58; for company employees (d), 3.81; and for others (e), 3.53. The verification statistics 387 show the F value to be 4.245 and the significance probability to be 0.003. Therefore, there is a 388 statistically significant variance in terms of accessibility.

389 4. Regarding sufficiency, the average for researchers (a) was 3.50; for students (b); 3.41, for
390 professors (c), 3.71; for company employees (d), 4.02; and for others (e), 3.86. The verification statistics
391 show the F value to be and the significance probability to be 0.001. Therefore, there is a statistically
392 significant variance in terms of sufficiency.

393 5. Regarding adequacy, the average for researchers (a) was 3.71; for students (b), 3.53; for
394 professors (c), 3.87; for company employees (d), 4.08; and for others (e), 3.94. The verification statistics
395 show the F value to be 3.209 and the significance probability to be 0.014. Hence, there is a statistically
396 significant variance in terms of adequacy.

6. Regarding utility, the average for researchers (a) was 3.35; for students (b), 3.50; for professors
(c), 3.21; for company employees (d), 3.76; and for others (e), 3.67. The verification statistics show the
F value to be 2.000 and the significance probability to be 0.096. Therefore, there is a statistically
significant variance in terms of utility.

7. Regarding user support, the average for researchers (a) was 3.23; for students (b), 3.28; for
professors (c), 3.55; for company employees (d), 3.64; and for others (e), 3.44. The verification statistics
show the F value to be 2.473 and the significance probability to be 0.046. Thus, there is a statistically
significant variance in terms of user support.

| | Company employee(d) | 3.83 | .717 | | | |
| | Others(e) | 3.61 | .654 | | | |

406 **Table 7.** Comparison of satisfaction by occupation (ANOVA)

8. Regarding interactivity, the average for researchers (a) was 3.44; for students (b), 3.47; for
professors (c), 3.63; for company employees (d), 3.83; and for others (e), 3.61. The verification statistics
show the F value to be 2.434 and the significance probability to be 0.049. Hence, there is a statistically

410 significant variance in terms of interactivity.

- 3.2.5. Analysis of the importance in determining factors in the three quality areas of the PRS and theinteractivity of its components
- 413 The authors conducted multiple regression analysis to determine the effect of system, one of the
- 414 three quality areas, on the importance of the recommendation service. Table 8 shows the results
- 415

| | Importance | | | | | | | | |
|----------------------|------------|------|------|-------|--------|-------|---------|-------|----------|
| Independent variable | В | SE | Beta | t | р | VIF | DW | R^2 | F |
| (Constant) | 1.963 | .236 | 1 | 8.313 | .000 | | | | |
| Ease of use | .322 | .076 | .356 | 4.249 | .000** | 1.924 | 2 2 2 2 | 214 | 28.725** |
| Design | .247 | .074 | .288 | 3.341 | .001** | 2.031 | 2.232 | .314 | (.000) |
| Accessibility | 036 | .079 | 037 | 451 | .653 | 1.837 | | | |

416 **Table 8.** The effect of system on the importance of the recommendation service

417 *p<0.05, **p<0.01 ad

418

419 Model F has a value of 28.725 and can be considered a statistically significant regression model. 420 The R-squared of the regression analysis is the equivalent of the coefficient of determination, and 421 signifies the proportion of variance in the dependent variable, which can be explained by the variable 422 element. The R-squared, at 31.4%, indicates a high degree of explanation. The variance inflation factor 423 (VIF) value can range from 1 to infinity, and the values between 1 and 10 indicate no problem of 424 multi-collinearity. Since the VIF is below 10, there is no problem of multi-collinearity. Since the 425 outcome of the Durbin-Watson statistic is close to 2, there is no autocorrelation, and the residuals are 426 independent of each other. Therefore, there is no problem with the variables. The standard 427 significance level is 0.05 (95%). Results lower than 0.05 are statistically significant, while those higher 428 than 0.05 are not.

429 Looking at ease of use in the regression analysis, the B value is 0.322. In terms of verification 430 statistics, the t value is 4.249, and the probability of significance is 0.000, indicating a statistically 431 significant amount of effect. Since the value of the standardized beta is 0.356, increasing 1 unit of ease 432 of use expands the importance by 0.356 (35.6%). In terms of design, the B value is 0.247. Regarding 433 verification statistics, the t value is 3.341 and the probability of significance is 0.001, demonstrating a 434 statistically significant amount of effect. As the value of the standardized beta is 0.288, increasing 1 435 unit of ease of use augments importance by 0.288 (28.8%). Looking at accessibility, the B value is -436 .036. For verification statistics, the t value is -.451 and the probability of significance is 0.653, 437 suggesting no statistically significant amount of effect.

438 Next, the authors conducted multiple regression analysis to determine the effect of
 439 recommended content on the importance of the recommendation service. Table 9 displays the
 440 outcomes.

441 Model F has a value of 23.886 and can be considered a statistically significant regression model. 442 The R-squared of regression analysis is the equivalent of the coefficient of determination and signifies 443 the proportion of the variance in the dependent variable, which can be explained by the variable 444 element. The R-squared, at 27.6%, indicates a high degree of explanation. The VIF value can range 445 from 1 to infinity, and the values between 1 and 10 indicate no problem of multi-collinearity. As the 446 VIF is below 10, there is no problem of multi-collinearity. Since the result of Durbin-Watson is close 447 to 2, there is no autocorrelation, and the residuals are independent of each other. Hence, there is no 448 problem with the variables. The standard significance level is 0.05 (95%). Results higher than 0.05 are 449 not statistically significant, while those lower than 0.05 are. 450

Importance

| Independent variable | В | SE | Beta | t | р | VIF | DW | R^2 | F |
|----------------------|-------|------|------|-------|--------|-------|-------|-------|----------|
| (Constant) | 1.855 | .249 | | 7.446 | .000 | | | 276 | |
| Sufficiency | .137 | .080 | .148 | 1.714 | .088 | 1.936 | 2 200 | | 23.886** |
| Adequacy | .357 | .084 | .371 | 4.257 | .000** | 1.969 | 2.296 | .276 | (.000) |
| Utility | .053 | .051 | .075 | 1.036 | .302 | 1.360 | | | |

451 452

 Table 9. The effect of content on the importance of the recommendation service

453 Looking at sufficiency in the regression analysis, the B value is 0.137. In terms of verification 454 statistics, the t value is 1.714 and the probability of significance is 0.088, indicating no statistically 455 significant amount of effect. Looking at adequacy, the B value is 0.357. In terms of verification 456 statistics, the t value is 4.257 and the probability of significance is 0.000, suggesting a statistically 457 significant amount of effect. Since the value of the standardized beta is 0.371, increasing 1 unit of ease 458 of use boosts importance by 0.371 (37.1%). Looking at utility, the B value is 0.053. In terms of 459 verification statistics, the t value is 1.037 and the probability of significance is 0.302, signaling no 460 statistically significant amount of effect.

461 Lastly, the authors conducted multiple regression analysis to determine the effect of service 462 support on the importance of the recommendation service. Table 10 shows the outcomes.

463

| | Importance | | | | | | | | |
|-------------------------|------------|------|------|--------|--------|-------|------|----------------|----------|
| Independent variable | В | SE | Beta | t | р | VIF | DW | R ² | F |
| (Constant) | 2.322 | .221 | 1 | 10.498 | .000 | | 2.04 | | 27.809** |
| User support | .197 | .090 | .227 | 2.184 | .030* | 2.636 | | .227 | |
| Interactivity | .258 | .096 | .277 | 2.672 | .008** | 2.636 | 0 | | (.000) |

464 **Table 10.** The effect of service support among three quality areas on the importance of the recommendation

465 service

 $466 \qquad *p{<}0.05, \, **p{<}0.01 \ ad$

467

468 Model F has a value of 27.809 and can be considered a statistically significant regression model. 469 The R-squared of regression analysis is the equivalent of the coefficient of determination, and 470 signifies the proportion of variance in the dependent variable, which can be explained by the variable 471 element. The R-squared, at 22.7%, signals a high degree of explanation. The VIF value can range from 472 1 to infinity, and the values between 1 and 10 indicate no problem of multi-collinearity. Since the VIF 473 is below 10, there is no problem of multi-collinearity. Given that the outcome of the Durbin-Watson 474 statistic is close to 2, there is no autocorrelation, and the residuals are independent of each other. 475 Hence, there is no issue with the variables. The standard significance level is 0.05 (95%). Results lower 476 than 0.05 are statistically significant, while those higher than 0.05 are not.

In terms of user support in the regression analysis, the B value is 0.197. Regarding verification statistics, the t value is 2.184 and the probability of significance is 0.030, suggesting a statistically significant amount of effect. Since the value of the standardized beta is 0.227, increasing 1 unit of ease of use extends importance by 0.227 (22.7%). Looking at interactivity, the B value is 0.258. For verification statistics, the t value is 2.672 and the probability of significance is 0.008, implying a statistically significant amount of effect. Since the value of the standardized beta is 0.227, increasing

483 1 unit of ease of use expands importance by 0.227 (22.7%).

16 of 21

484 3.2.6. Pearson's correlation analysis for examining the correlation among the PRS components

In order to examine whether there is a significant correlation among the components of the
service's three areas of quality, the authors employed a Pearson correlation analysis, as shown in
Table 10.

| Section | Ease of | Decign | Accessi | Sufficiency | Adoguacy | l Itility | User | Interactivit | Importanc |

518 4. Implications

517

519 This authors conducted a user survey on KOSEN's PRS to examine the information usage 520 behavior of Korean scientists and engineers who access the PRS. In order to investigate the usage 521 status of the service, the authors analyzed usage behavior by employing statistically significant data. 522 They also explored the importance of the components of service quality, as well as the correlations 523 among them.

524 The analysis yielded the following outcomes in regard to the three research questions. The 525 results enabled the understanding of the information usage behavior of Korean scientists and 526 engineers in relation to the PRS, as well as the effects of the three areas of quality (system, content, 527 and service support) on the perceived importance of the service. A method for improving the system 528 will be proposed in the following chapter.

529 First, regarding the answer to whether PRS usage behavior varies based on users' demographic 530 traits, in terms of gender, the primary purpose of using the service for males was information 531 accessibility, whereas for females, it was the adequacy of the suggested information. The differences 532 according to gender as well as major field of study were statistically significant. There was no 533 statistically significant difference based on age, education level, or occupation.

534 Secondly, the answer to whether the satisfaction rate of the service's three areas of quality 535 (system, contents, and service support) shows variance according to users' demographic attributes 536 was that the variance in the overall satisfaction rate according to gender was marginal. As with 537 gender, the variance in the overall satisfaction rate based on age, education level, and occupation was 538 also marginal and therefore statistically insignificant. However, the ANOVA used to measure the 539 variance according to occupation revealed a statistically significant variance in seven out of eight 540 components (ease of use, design, accessibility, sufficiency, adequacy, user support, and interactivity) 541 of the three areas of quality, excluding utility. Regarding the number of visits, there was only a 542 statistically significant difference in terms of education level. For the difference in the service use time 543 according to demographic traits, neither age, gender, education level, major field of study, or 544 occupation showed a statistically significant difference in information usage behavior.

545 Third, the answer to what some of users' key concerns are, and if there is a significant correlation 546 among the three areas of quality that pertain to them, was as follows:

547 The authors conducted multiple regression analysis in order to determine the effect of system 548 (one of the three areas of quality) on the importance of the recommendation service. Looking at ease 549 of use, the B value is 0.322 and the probability of significance is 0.000, indicating a statistically 550 significant amount of effect. For design, the B value is 0.247 and the probability of significance is 551 0.001, suggesting a statistically significant amount of effect. However, in terms of accessibility, the B 552 value is -.326 and the probability of significance is 0.653, demonstrating no statistically significant 553 amount of effect.

554 In the analysis of the effect of system on the importance of the recommendation service, 555 sufficiency has a B value of 0.137 and a probability of significance of 0.088, implying no statistically 556 significant amount of effect. Looking at adequacy, the B value is 0.357 and the probability of 557 significance is 0.000, pointing to a statistically significant amount of effect. For utility, the B value is 558 0.053 and the probability of significance is 0.302, reflecting no statistically significant amount of effect.

559 Lastly, in the analysis of the effect of service support on the importance of the recommendation 560 service, user support has a B value of 0.197 and a probability of significance of 0.030, signaling a 561 statistically significant amount of effect. Interactivity has a B value of 0.258 and a probability of

562 significance of 0.008, revealing a statistically significant amount of effect.

18 of 21

To summarize the outcomes, of the eight components of the three areas of quality, ease of use, design, adequacy, user support, and interactivity had a statistically significant amount of effect on the importance of the PRS. This means that users of the recommendation service valued ease of use and efficient design (the system components), as well as adequacy of information (the content component). Users considered user support and interactivity (the service components) to be as important as the recommendation service itself.

569 The answer to whether there was a significant correlation among the components of the three 570 areas of quality was that all eight components reveal importance and a statistically significant degree 571 of correlation. For system quality, ease of use and importance had a correlation coefficient of 0.520, 572 design and importance had a correlation coefficient of 0.495, and accessibility and importance had a 573 correlation coefficient of 0.356, all demonstrating a statistically significant correlation. For content 574 guality, sufficiency and importance had a correlation coefficient of 0.434, adequacy and importance 575 had a correlation coefficient of 0.507, and utility and importance had a correlation coefficient of 0.321, 576 all suggesting a statistically significant correlation. For service support quality, user support and 577 importance had a correlation coefficient of 0.445, while interactivity and importance had a correlation 578 coefficient of 0.456.

579 Moreover, a significant correlation with a correlation coefficient of 0.6 and above was present 580 between ease of use and design, ease of use and sufficiency, ease of use and adequacy, design and 581 accessibility, design and sufficiency, design and adequacy, design and interactivity, sufficiency and 582 adequacy, sufficiency and interactivity, adequacy and user support, and user support and 583 interactivity.

584

585 5. Conclusion

586 The authors derived the following conclusions based on an examination of pre-existing studies 587 and the analysis of the user survey.

588 1. The predominant reason for non-use of the PRS was that users did not know how to use it;
589 80.6% of surveyees marked this reason for their non-use.

590 2. In terms of the difference in the information usage behavior of PRS users according to 591 demographic characteristics, gender and major field of study revealed a statistically significant 592 difference in the purpose of using the service, and education level presented a statistically significant 593 difference in the number of visits. No other significant differences were observed.

3. In the three areas of quality (system, content, and service support), the variance in the satisfaction rate for each according to demographic traits (gender, age, education level, and major field of study) was marginal. However, regarding the service satisfaction rate per occupation, there was a statistically significant variance in seven out of the eight components of the three areas of quality (ease of use, design, accessibility, sufficiency, adequacy, user support, and interactivity), excluding utility.

600 4. Of the eight components, five (ease of use, design, adequacy, user support, and interactivity)
601 demonstrated a statistically significant amount of effect on the importance of the PRS, meaning that
602 they are the components users were most concerned with.

6035. Regarding the components that users deemed important in the PRS, five out of the eight (ease604of use, design, adequacy, user support, and interactivity) had a statistically significant effect on605determining the importance of the service.

606

607 5.1. Proposals to improve the PRS

The authors derived the following conclusions based on an examination of pre-existing studiesand the analysis of the user survey.

610 1. The predominant reason for non-use of the PRS was that users did not know how to use it;

611 80.6% of surveyees marked this reason for their non-use.

612 2. In terms of the difference in the information usage behavior of PRS users according to 613 demographic characteristics, gender and major field of study revealed a statistically significant 614 difference in the purpose of using the service, and education level presented a statistically significant 615 difference in the number of visits. No other significant differences were observed.

616 3. In the three areas of quality (system, content, and service support), the variance in the 617 satisfaction rate for each according to demographic traits (gender, age, education level, and major 618 field of study) was marginal. However, regarding the service satisfaction rate per occupation, there 619 was a statistically significant variance in seven out of the eight components of the three areas of 620 quality (ease of use, design, accessibility, sufficiency, adequacy, user support, and interactivity), 621 excluding utility.

4. Of the eight components, five (ease of use, design, adequacy, user support, and interactivity)
demonstrated a statistically significant amount of effect on the importance of the PRS, meaning that
they are the components users were most concerned with.

625 5. Regarding the components that users deemed important in the PRS, five out of the eight (ease
626 of use, design, adequacy, user support, and interactivity) had a statistically significant effect on
627 determining the importance of the service.

628 5.2. Limitations of the present study and future research

629 The present study offers an analysis of a user survey on KOSEN's PRS and the results cannot be630 generalized. Future research must broaden the scope of analysis to include multiple PRS.
