## Electronic Supporting Information

# Monitoring the Interfacial Polymerization of Piperazine and Trimesoyl Chloride with Hydrophilic Interlayer or Macromolecular Additive by in-situ FT-IR Spectroscopy 

[^0]

Figure S1. ATR/FT-IR spectra of PSf substrate and PSf substrates modified with PDA/PEI, TA/PEI and ZIF-8/PEI interlayers, respectively.

Figure S2. Surface morphologies observed by FESEM images of PSf substrate and PSf substrates modified with PDA/PEI, TA/PEI and ZIF-8/PEI interlayers, respectively.

Figure S3. (a) Water contact angle and (b) zeta potential of PSf substrate and PSf substrates modified with PDA/PEI, TA/PEI and ZIF-8/PEI interlayers, respectively.

Figure S4. ATR/FT-IR spectra of the polyamide-based membranes formed on the substrates modified with the interlayers and/or with the macromolecular additives in the solution of PIP.

Figure S5. Three-dimension spectra measured by in-situ FT-IR spectroscopy for the polyamide formation as a function of interfacial polymerization time, with different modified interlayers and/or macromolecular additives in the solution of PIP.

## UV-vis analysis of diamine diffusivity

The diffusion of diamine monomers were measured by UV-vis absorption spectra, using an ultraviolet spectrophotometer (Shimadzu, UV 2450, Japan). By taking 3 mL hexane solution approximately at the hexane/water interface, diamine concentration and diffusivity were measured by ultraviolet analyses and acyl chloride monomer was not added in the hexane phase. Initial diffusivity $D_{0}$ and the corresponding $D$ are calculated by the following equation (S1):
$J=\frac{d m}{A d t}=-D_{0}\left(\frac{\partial C}{\partial X}\right)$
where $J$ is the diamine diffusive flux, $d m, A$ and $d t$ are the diamine mass, contact area and diffusion time, respectively. $D_{0}$ is the initial diffusivity, $\partial C$ and $\partial X$ are the concentration change and diffusion distance (approximately $\sim 10^{-5} \mathrm{~cm}$ ).

Figure S6. UV-vis absorption spectra of diamine monomer diffusion from water to hexane (the organic solution is hexane without acyl chloride monomer) and the calibration stand curve of absorbance $v s$. diamine concentration.

Table S1. According to UV-vis adsorption spectra, the concentration and diffusivity of diamine monomers were determined, which were calculated by equation (S1).

|  | PSf | PDA/PEI | TA/PEI | ZIF-8/PEI | PEG | PVP | PVA |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Absorbance |  |  |  |  |  |  |  |
| (a.u.) | 1.115 | 0.459 | 0.406 | 0.343 | 0.248 | 0.163 | 0.128 |
| Concentration |  |  |  |  |  |  |  |
| $(\mathrm{mM})$ | 0.728 | 0.288 | 0.252 | 0.210 | 0.146 | 0.089 | 0.066 |
| Diffusivity |  |  |  |  |  |  |  |
| $\left(\times 10^{-6} \mathrm{~cm}^{2} / \mathrm{s}\right)$ | 11.96 | 4.73 | 4.14 | 3.45 | 2.39 | 1.46 | 1.08 |

## Adsorption of the diamine monomers measured by TOC analyzer

The PSf substrate and substrates with the modified interlayers were cut in to square pieces of 1 $\mathrm{cm}^{2}$ area and immersed in diamine solution for 10 minutes. The equilibrium adsorption amount were obtained after 24 h diamine release in 30 mL DI water and total organic carbon of diamine monomers were quantified by a TOC analyzer (TOC, GE Sievers InnovOx ES, USA).

Table S2. Adsorption mass of diamine monomers measured by TOC analyzer.

|  | PSf | PDA/PEI | TA/PEI | ZIF-8/PEI | PEG | PVP | PVA |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Mass (g) | 0.00745 | 0.00759 | 0.00768 | 0.00772 | 0.00745 | 0.00745 | 0.00745 |
| PIP (ppm) | 8.78 | 29.9 | 88.6 | 224 | 9.10 | 10.2 | 10.5 |
| Q (mg/g) | 1.18 | 3.94 | 11.5 | 29.0 | 1.22 | 1.37 | 1.41 |

## Binding energy simulation

Binding energy simulations were performed between the PIP and interlayers and/or with macromolecular additives in the PIP solution. It is conducted in Materials Studio 7.0. Firstly, all the molecules were constructed and then optimized by Forcite module. The binding energy ( $E_{\mathrm{b}}$ ) in the COMPASS force-field of PIP and other molecules were calculated using the equation (S2) [1]:
$E_{\mathrm{b}}=E_{\text {PII-molecule }}-\left(E_{\mathrm{PIP}}+E_{\text {molecule }}\right)$
where $E_{\text {PII-molecule }}$ is the system total energy, $E_{\text {PIP }}$ and $E_{\text {molecule }}$ are the energies of the PIP and other molecules, respectively. The binding energy is the combination of attractive and repulsive forces between these molecules.

$\Delta \mathrm{E}($ PIP-PIP $)=-1.51 \mathrm{kcal} / \mathrm{mol}$

$\Delta \mathrm{E}($ PDA-PIP $)=-5.29 \mathrm{kcal} / \mathrm{mol}$

$\Delta \mathrm{E}($ ZIF-8-PIP $)=-7.06 \mathrm{kcal} / \mathrm{mol}$

$\Delta \mathrm{E}($ PEG-PIP $)=-2.65 \mathrm{kcal} / \mathrm{mol}$

$\Delta \mathrm{E}($ PSf-PIP $)=-2.06 \mathrm{kcal} / \mathrm{mol}$

$\Delta \mathrm{E}(\mathrm{TA}-\mathrm{PIP})=-6.20 \mathrm{kcal} / \mathrm{mol}$

$\Delta \mathrm{E}(\mathrm{PVA}-\mathrm{PIP})=-3.43 \mathrm{kcal} / \mathrm{mol}$

Figure S7. Binding energies calculated between PIP and other molecules.

Figure S8. Polyamide volume fractions converted from in-situ FT-IR spectra.

Figure S9. Diamine diffusivity with the interfacial polymerization time, showing depressed and "self-limiting" effect.
$D=D_{0}(1-\phi)^{\alpha}$
where the corresponding diffusivity $D$ is calculated from the empirical formula, in which $D_{0}$ is the initial diffusivity, $\varphi$ is the polyamide volume fraction and $\alpha$ typically varies in the range of $1<\alpha<3$ [2].

## Determination of the polyamide layer thickness by FT-IR spectroscopy

Thickness of the polyamide layer was probed by FT-IR with an ATR accessory (Ge crystal, $45^{\circ}$ incident angle), using the equations (S4 and S5) [3]:

$$
\begin{equation*}
d_{\mathrm{p}}=\frac{\lambda}{2 \pi \sqrt{n_{1}^{2} \sin ^{2} \theta-n_{2}^{2}}} \tag{S4}
\end{equation*}
$$

where $d_{\mathrm{p}}$ is the penetration depth, $\lambda$ is the wavelength of infrared radiations, $n_{1}$ and $n_{2}$ are refractive indices of the crystal and the sample. Since $n_{1}=4.0$ (Ge crystal), $n_{2}=1.50$ (polyamide sample) and $\theta=$ $45^{\circ}, d_{\mathrm{p}}=0.066 \lambda$. The characteristic absorbance at $1640 \mathrm{~cm}^{-1}$ was transformed into the polyamide layer thickness [4]:
$T=-\ln \left[\frac{A_{\mathrm{b}}(T)}{A_{\mathrm{b}}(0)}\right] \times \frac{d_{\mathrm{p}}}{2}$
where $T$ is the thickness, $A_{\mathrm{b}}(T)$ and $A_{\mathrm{b}}(0)$ are the absorbance of a band at the layer thickness of $T$ and 0 , respectively.

Table S3. Polyamide layer thickness acquired from in-situ FT-IR spectroscopy, which were fitted mathematically with the equation of $X=A t^{b}$.

|  | PSf | PDA/PEI | TA/PEI | ZIF-8/PEI | PEG | PVP | PVA |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A | 24.8 | 7.3 | 4.0 | 0.6 | 5.4 | 3.3 | 0.5 |
| b | $1 / 2$ | $1 / 2$ | $1 / 2$ | 1.0 | $2 / 3$ | $2 / 3$ | 1.0 |

Figure S10. TEM observation of polyamide layer thickness formed on the PSf substrate.

Figure S11. FESEM images of surface morphologies of polyamide layers formed on the PSf substrate and PSf substrates modified with interlayers, and/or doped polyamide layer with macromolecular additives in the solution of PIP.

Figure S12. AFM images of surface topographies of polyamide layers formed on the PSf substrate and PSf substrates modified with interlayers, and/or doped polyamide layer with macromolecular additives in the solution of PIP.

Table S4. Surface roughness of the membrane samples measured from AFM images.

| Membranes | $\mathrm{R}_{\mathrm{a}}(\mathrm{nm})$ | $\mathrm{R}_{\mathrm{q}}(\mathrm{nm})$ |
| :---: | :---: | :---: |
| PSf IP | 53 | 79 |
| PDA/PEI IP | 52 | 81 |
| TA/PEI IP | 66 | 84 |
| ZIF-8/PEI IP | 131 | 189 |
| PEG IP | 54 | 73 |
| PVP IP | 72 | 103 |
| PVA IP | 95 | 113 |

Table S5. XPS analyses of element component of the polyamide membrane surface and the corresponding calculated $\mathrm{O} / \mathrm{N}$ ratio.

| Membranes | $\mathrm{C}(\%)$ | $\mathrm{N}(\%)$ | $\mathrm{O}(\%)$ | $\mathrm{O} / \mathrm{N}$ |
| :---: | :---: | :---: | :---: | :---: |
| PSf IP | 70.51 | 12.15 | 17.34 | 1.43 |
| PDA/PEI IP | 67.72 | 10.60 | 21.68 | 2.04 |
| TA/PEI IP | 67.62 | 10.91 | 21.47 | 1.97 |
| ZIF-8/PEI IP | 68.38 | 11.80 | 19.82 | 1.68 |
| PEG IP | 69.01 | 11.57 | 19.42 | 1.68 |
| PVP IP | 68.81 | 13.12 | 19.07 | 1.57 |
| PVA IP | 69.65 |  | 1.15 | 1.30 |

Table S6. Water contact angle and zeta potential of the formed polyamide membrane.

| Membranes | Contact angle $\left({ }^{\circ}\right)$ | Zeta potential $(\mathrm{mV})$ |
| :---: | :---: | :---: |
| PSf IP | $75 \pm 4.4$ | -38.2 |
| PDA/PEI IP | $35 \pm 3.6$ | -16.8 |
| TA/PEI IP | $43 \pm 3.3$ | -13.4 |
| ZIF-8/PEI IP | $48 \pm 4.2$ | -12.6 |
| PEG IP | $29 \pm 3.2$ | -32.5 |
| PVP IP | $28 \pm 2.4$ | -29.4 |
| PVA IP | $26 \pm 2.8$ | -25.6 |

Table S7. Rejections of polyamide membrane for different kinds of inorganic salts.

| Membranes | $R_{\text {PDA/PEI }}(\%)$ | $R_{\text {TA/PEI }}(\%)$ | $R_{\text {ZIF-8/PEI }}(\%)$ | $R_{\text {PEG }}(\%)$ | $R_{\text {PVP }}(\%)$ | $R_{\text {PVA }}(\%)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{Na}_{2} \mathrm{SO}_{4}$ | 97.5 | 97.8 | 98.2 | 97.4 | 98.2 | 98.4 |
| $\mathrm{MgSO}_{4}$ | 97.2 | 97.6 | 97.8 | 97.5 | 97.8 | 98.2 |
| $\mathrm{MgCl}_{2}$ | 69.5 | 70.3 | 73.4 | 80.9 | 85.6 | 87.3 |
| $\mathrm{CaCl}_{2}$ | 68.1 | 68.6 | 69.4 | 78.4 | 83.6 | 85.4 |
| NaCl | 42.5 | 43.6 | 45.2 | 52.8 | 53.6 | 54.2 |
