Abstract: The Sustainable Development Goals (SDGs) is a global strategy that aims to obtain a more equitable and just world. These objectives are organized in 17 SDGs, detailed in 169 targets. Different international institutions have emphasized education’s relevance to developing citizens who contribute to the SDGs’ achievement for 2030. However, a review focused on Physical Education has yet to be performed. Therefore, the objective of this work is double. First, to analyze and select the SDGs’ specific goals that can be implemented in the subject of Physical Education. And second, to relate these specific goals to the different models based on Physical Education practices. This review showed how three institutional documents have previously related sport, physical exercise, and physical education to the SDGs’ specific goals. Based on the search done, this review article selects those goals that could be integrated into the educational context through Physical Education. The bibliographic and critical analysis in this research shows that of the 169 specific goals proposed in the SDGs, only 24 could be worked on in Physical Education. In addition, after this previous analysis, a proposal for the relationship between the practice-based models and these 24 goals is presented. The contributions made in this paper will allow teachers to establish links between PE sessions and SDGs while raising awareness to develop students who contribute to a more sustainable world.

Keywords: sustainability development; physical education; physical activity; pedagogical research

1. Introduction

1.1. Agenda 2030 and Education

The growing global concern about caring for the planet and ensuring prosperity for all meant that by 2015 the United Nations established a series of global goals [1]. These objectives are grouped into 17 Sustainable Development Goals (SDGs), which in turn are divided into 169 specific targets that detail and specify each of the SDGs [2]. This proposal of global sustainability is framed under the concept "Agenda 2030" and emphasizes that all levels of society, both collective and individual, must contribute to the SDGs’ achievement [3]. In addition to focusing on ecology as a central axis, these objectives include additional problems such as circular production, waste generation, poverty or health and welfare, urban development or peace, among others [1]. In this way, many spheres of intervention will be covered, not only environmental but also economic, ethical and socio-logical [4], with a clear purpose, such as balancing current development with future progress. However, although the SDGs were a proposal to be achieved in 15 years (2015-2030), some research has highlighted that the SDGs’ pace of achievement is not as fast as expected [5]. Therefore, all government and non-government institutions must collaborate to facilitate the acquisition of these [6].
Within these institutions, education should be considered a key factor in consolidating sustainable habits in future generations [7,8]. Since the United Nations Decade of Education for Sustainable Development (2005-2014) [9], already detailed this importance, pointing to integrating sustainable development actions into all aspects of education to promote changes in knowledge and attitudes towards sustainability. Therefore, at the institutional level, education, in all its amplitude, is one of the main axes on which to structure sustainability [10]. Lauder et al. [11] highlighted the importance of education in responding to the planet’s socio-environmental problems. This importance is recognized by Sachs [6], which highlighted how education was a key factor in achieving the longstanding proposal of the Millennium Goals.

Although Education is addressed directly in SDG 4, “Quality Education,” UNESCO [12] established the concept of Education for Sustainable Development (ESD), aiming at empowering students to make responsible decisions in pursuit of a just society, economic and environmental integrity in the present and future generations. About this idea, teachers’ decisive role as those responsible for educating future generations has been pointed out [13]. However, the different institutions must clarify their goals, indicators and concrete actions to the SDGs to develop results frameworks and collect data on the level of achievement [14].

1.2. Physical Education, Physical Activity and Sport. A Key Tool in Obtaining the SDG

The study of sport and physical activity (PA) contribution to obtaining the SDGs has been mainly carried out by three institutions. First, the Sixth International Conference of Ministers and Senior Officials Responsible for Physical Education and Sport (MINEPS VI) [15]. This Conference identified three broad areas of intervention that aimed to (I) develop an inclusive vision of access for all to the sport, Physical Education (PE) and PA, (II) maximize sport’s contribution to sustainable development and peace, and (III) protect the integrity of the sport. This paper reviews the various SDGs proposed to highlight those relevant to PA and Sport (Table 1). However, the PE role in Agenda 2030 is not specifically set out. Parallel to MINEPS VI, the Commonwealth published a document where the contribution of sport to the SDGs was clarified [16]. This document had the peculiarity of establishing a series of indicators and achievements that will measure the contribution of the different areas associated with sport more objectively when developing the SDGs. At the same time, it served as a reference along with the indications presented at MINEPS VI, to publish a new report detailing what specific goals of each SDGs could be worked on through sport [14], but also the specification regarding the PE was not detailed.

Finally, in 2019, the Ibero-American Sports Council and the Ibero-American General Secretariat jointly published a report establishing sport as a tool for working towards sustainable development [17]. In this case, they selected those goals of the SDGs that could be worked on through the EF, sports practice or sport as an institution while establishing a thorough analysis of how this relationship occurs (one-way or two-way) and proposing a series of strategies and partnerships for the promotion of sustainable development. This report’s main findings were that not all the specific goals for each objective have the same directionality and impact with sport, simplifying into a direct relationship with 8 of the 17 SDGs and 19 of the 169 specific goals (table 1). Another example of sport and PA’s relationship with the SDGs is reflected in the narrative review of Day & Menhas [18]. However, again these authors cannot separate PE from the relationship with the specific goals proposed by UNESCO. Finally, other institutions such as the WHO have confirmed these relationships and shown the health, social, and economic benefits of contributing to 13 of the 17 SDGs, but do not specify concrete goals that could be worked in conclusion, these institutional proposals emphasize the unified analysis of the concept of sport, physical exercise and PA, so much so that MINEPS VI [15], begins by considering this conceptual appreciation, “the term ”sport” is used as a generic term that includes sport for all, physical play, leisure, dance and organized, improvised, competitive, traditional and in-
indigenous sports and games in their different manifestations” (p.1). In contrast, the Commonwealth also details the terminological differences between sport, organized sport, PA, physical exercise, PE and quality PE [14]. But despite recognizing these differences, the selection of goals of each SDGs was treated from the general concept of sport.

In short, it is of particular interest and necessity to establish meeting points to address the different challenges of the future from a multidisciplinary approach, and that is where the main objective of the study resides when establishing the possible relationships between PE, as a discipline that has among other curricular objectives PA in the natural environment as enjoyment and care of the environment, and the Sustainable Development Goals (SDG) from the review, analysis and relationship of the different specific goals; It is specifically proposed to analyze the possible relationships of the new pedagogical models in PE as an engine of methodological change, with the goals derived from the 2030 Agenda to lay the foundations for future research related to the work that can be carried out from educational centers and specifically from PE for sustainable development, as a priority objective of the new legislative frameworks in education.

For all these reasons, this research’s main objective was to analyze and select the specific goals of the SDGs that can be implemented in the subject of PE. In addition, having clarified which specific goals can be worked on in PE, this work aims to relate these specific goals to the different models based on PE practices.

2. Systematic Review used

For this study, a critical review has been used, as defined by Grant & Booth [19], whose main objective lies in the critical evaluation of all the existing literature on the study’s objectives, beyond mere description, including the degree, analysis and conceptual innovation that it entails, in addition to identifying the most important elements in the field of knowledge. This approach to the study leads us to a future line of research or establishing a proposal or intervention model based on pedagogical models in our study, as is typical of this type of work as indicated by the authors mentioned above. Similarly, we could identify common elements with a narrative review, such as the search or review of the complete literature or not; and may or may not include a quality assessment, which is in line with our work. This type of review is truly useful in education since it allows us to detail in a justified and understandable way certain realities that may go unnoticed [20]. Narrative reviews help the reader understand the essence of the content displayed, providing evidence and justification for the text [21]. Its use in research is necessary and fundamental since it allows justifying facts, situations and evidence from an explanatory point of view, and it is not new in the science and education of sport in our field [22].

In this case, the contribution is significant within the PE, giving rigor to such substantial elements as methodology and evaluation.

Therefore, it is not a traditional systematic review, but rather an argumentative, critical explanation about the justification of the close relationships and the contribution from the PE area and specifically from pedagogical models can be made to sustainable development as a priority objective globally. For this, the United Nations' objectives under the concept of “Agenda 2030” and the specific goals derived from them are presented as main elements, reflecting all the possible actions that can be carried out from the scope of PE. Therefore, it does not make sense to present the aspects related to the inclusion and exclusion criteria or the reliability of the data extraction, more related to systematic reviews of an analytical and quantitative nature.

Detecting gaps in the literature, this critical review’s first objective was to select those SDG targets that could be implemented in PE. For this purpose, an exhaustive analysis of
the institutional contributions is presented in Table I. This table shows that of the 169 specific goals proposed by UNESCO, the relationship between sport and sustainable development can be seen in 68 of them, approximately 40% in the case Ibero-American Sports Council (IBC) [17]. However, the Sixth International Conference of Ministers and Senior Officials Responsible for Physical Education and Sport [15] selects a total of 7 SDGs that relate to PA, sport and PE.

The importance of this relational analysis between PE and SDGs could be justified by the very significance UNESCO accords to PE. An example of this is to see how, since 1978, the International Charter of Physical Education and Sport [23]. The role of sport and PE was extolled as a fundamental right for everyone. Also, Agenda 2030 mentions a recognition of sport as an “important facilitator of sustainable development and peace”, adding that it can “increasingly contribute to making development and peace a reality by promoting tolerance and respect”, to “support the empowerment of women and youth, individuals and communities” or to “achieve goals in health, education and social inclusion”[24]. Despite this, analyzing the ONU document for the ESD, PE, activity or physical exercise is not commented [12]. This lack of precision in the role of PE within SDGs may carry some risk, going unnoticed by the relevant bodies. Despite institutional efforts to increase the number of PA practice hours, among other issues, the WHO recently showed that 80% of adolescents and young people still do not carry out the minimum recommended amounts, and something that is extremely worrying is the increase in sedentary lifestyles [25]. This recent report has established new PA recommendations of approximately 60 minutes per day of moderate to vigorous aerobic activity for children and adolescents and at least 150 to 300 minutes per week for adults. In addition, during the COVID-19 pandemic period, the importance of performing PA routines to enhance the immune system has been highlighted[26]

Note. IBC: Ibero-American Sports Council; MINEPS: Ministers and Senior Officials Responsible for Physical Education and Sport; ✓ (Direct and bidirectional relationship) + (Indirect or unidirectional relationship) - (No relationship specified)
The institutional analysis carried out through the proposals of the IBC (2019), the MINEPS (2017) and the Commonwealth (2017) was made considering the concept of Sport, Physical Exercise and PA. Although a terminological differentiation is proposed in the Commonwealth case, it is not differentiated in the relationship with the SDGs. However, it is essential to note that these concepts are not synonymous and have specific limitations and possibilities independently. For this reason, to respond to the objective of this work, we have taken as a reference the indications presented by the institutions (table 1) and thus be able to carry out an analysis exclusively from the exclusive concept of PE, since to the best of our knowledge, no document defines the role of PE in the contribution of ONU SDGs. Therefore, PE may not have as many possibilities of intervention in some specific goals of the SDGs, or, on the contrary, it may be an essential piece in the achievement of some Agenda 2030 goals. Thus, it has been considered necessary to isolate the concept of PE and present a proposal where this matter can be related to the SDGs and their specific targets.

3.1. SDG 3. Good Health and Well-Being

Firstly, the analyzed document coincides with SDG 1 "no poverty" and 2 "zero hunger", therefore the first relationship is established with SDG 3. Table I showed four SDG 3 that could be related to PE. However, it should be considered that target 3.3 cannot be directly treated in this area. On the other hand, both targets 3.4, 3.5 and 3.6 could be worked directly in PE. The improvement of mental health and well-being expressed in goal 3.4 is one of the most evident relationships established through PE sessions. There is enough evidence to confirm that PA practice increases students' psychological quality [27,28], understood such practice as the activity carried out continuously and systematically. In relation to target 3.5, a direct relationship can be established with PE, as this subject can keep young people away from substance use [29,30]. About sex education, as set out in SDG 3.7, a direct link should be considered as the PE helps with knowledge of one's own body and to strengthen sexuality [31]. Finally, SDG 3.6 has been added since driver education is a content that appears in some PE curriculum, so it is feasible to consider a direct relationship between both.

It is interesting to note that, taking the name of SDG 3, health and wellbeing, as an exclusive reference, it could be understood that it is one of the SDGs most related to the PE. However, out of the 13 goals it is composed of, only 4 have been considered to be worked on through the PE (31%).

3.2. SDG 4. Quality Education

The selection of goals made by the institutions studied makes SDG 4 one of the most relevant to the PE. Firstly, target 4.1 is considered to have a direct relationship with the PE, as established in the UN [23], PE is a "fundamental right of all" and therefore a crucial component of equitable and quality education. Furthermore, there is sufficient evidence at the neuroscientific level that establishes a positive relationship between the realization of PA and academic and/or cognitive performance [32–34]. For example, improved concentration [35], better performance in general executive function [33,36] or an increased sense of well-being or dream quality [37,38]. Target 4.4 is oriented in the same direction by sport in general [14,17], as it involves developing personal skills related to employment [39]. Target 4.5 points out the importance of reducing inequalities, highlighting gender and vulnerable people. In this case, the relationship with the PE would also be direct as it allows the integration of values such as teamwork, companionship, cooperation, and an ideal opportunity to develop co-education [40].

A similar situation occurs with target 4.7, emphasizing the importance of improving knowledge to promote sustainable development. In this case, the PE is working on PA implementation in natural environments and presenting sustainable alternatives such as the use of bicycles [41,42]. The IBC [17] established a two-way relationship with this goal. PE should be considered as an opportunity to generate self-constructed materials or the design of alternative sports that reuse a sports space or facility for a purpose other than
its original one [43]. However, PE in itself cannot directly offer a sports facility’s improvement, so the relationship with this goal is indirect. Finally, the possibility of working on goal 4.b to facilitate the increase of scholarships in developing countries has been discussed, but this possibility seems more the responsibility of sports institutions than schools.

3.3. SDG 5. Gender Equality

Gender equality in SDGs has been presented as an essential foundation for building a peaceful, prosperous and sustainable world [1]. Specifically, in the case of the PE, it has been described as a reflection of society, where gender norms are expressed in such a way that women are less likely than men to participate in P-A outside of the educational field [15], for this reason, the PE should be an opportunity to promote women’s empowerment and leadership, avoiding discriminatory stereotypes [17].

The institutions’ targets’ analysis considers the direct relationship between PE and targets 4.1 in eliminating discrimination against women. For example, the tone used in class to talk to students may be perceived as different [40]. Factors such as these need to be monitored during PE classes to generate student awareness of gender inequalities. Likewise, PE in Pre-school Education or the first years of Secondary Education is an opportunity to show that there are no differences in physical performance between men and women [41], this justification being extrapolate to goals 5.2 and 5.5. Furthermore, as stated by MINEPS [15], "the strong and active participation of women in decision-making processes has a major impact on social development". (p. 11), so the empowerment of women (target 5.c) can be achieved through the presentation of physical-sports initiatives that are attractive to them from the PE, but these initiatives must also have the support of institutions outside the education sector to offer an opportunity for practice outside the educational context.

Finally, the inclusion of target 5.3 is not considered for its work from the PE. However, this suggestion of an indirect relationship is proposed by the Commonwealth and is justified by the empowerment that sport can generate in women [14].

3.4. SDG 8. Decent Work and Economic Growth

This SDG aims to ensure inclusive and sustained economic growth that can generate decent jobs for all [1]. Although the sport has been described as a source of economic growth and an opportunity for decent employment [17], the reality is that the PE has a little direct relationship with this SDG. However, the values worked on in the PE are similar to skills that are supposed to be crucial to employability, such as cooperation, fair play or goal management [14,39].

However, from a perspective focused exclusively on job creation, the PE does not have a clear relationship, although it is true that a competitive use of the PE through, for example, the Sports Education model could allow students to learn sport-related professions such as analyst, trainer or journalist among others [44] it cannot be considered a direct relationship between employability and the PE.

This lack of a direct relationship with the PE has meant that the IBC [17] has not established a relationship with any of the goals among the institutional ones analyzed. Of the purposes that have been related, 8.3 and 8.9 are considered to have the potential to be worked on in PE. The first of these emphasizes the possibilities of sport in general as a way to entrepreneurship and innovation, although this goal could also be related to the 4.4. As mentioned above, among the PE pedagogical models, the Sports Education model can be a method to promote employment alternatives directly related to sport. As highlighted in MINEPS [15], "The attractiveness of sport for young people makes it a valuable framework for employability initiatives" (p.10). In addition, target 8.9 highlights the opportunity to generate sustainable tourism while promoting local culture. PE has a direct relationship with this goal. It works on content that supports alternative employment in the framework of natural environments and sustainability, and the work of traditional sports and games or local food products is also related to the PE.
3.5. SDG 10. Reduced Inequalities

SDG 10 aims to reduce inequalities to ensure the Sustainable Development Goals [1]. Sport is undoubtedly an opportunity for social inclusion and diversity, as equal opportunities can be promoted through sport [17]. Targets 10.2 and 10.3 include the importance of this equality, which the PE could work on directly, as it has been shown that the PE sessions promote cooperative attitudes and inclusion [45–47]. Regarding goal 10.7, its contribution from the PE is not considered, as both institutions [14,15] selected this goal considering the benefits of professional sport to promote opportunities in underdeveloped countries. This aspect does not apply to PE.

3.6. SDG 11. Sustainable Cities and Communities

The IBC [17] relates SDG 11 mainly through the bidirectionality of accessible sports facilities in cities and the opportunity for better social cohesion and equal opportunity. Therefore, although the proposal of goals made by the three institutions analyzed is coincidental (11.3 and 11.7), in both cases, their relationship with the PE is not contemplated. A relationship with the PE could be considered, for example, through activities framed within a Service Learning aimed at improving or developing the care of a park to carry out PA. However, this is a characteristic of the service-learning model rather than PE itself.

3.7. SDG 12. Responsible Consumption and Production

This SDG is part of natural resources’ responsible use to avoid destructive effects on the planet [1]. This approach has been mainly related to institutionalized sports properties; as the IBC [17] indicates, sport can improve sustainable living awareness, both for products and sports facilities or events. From an educational perspective, MINEPS [15] focuses on the importance of educational programs to raise awareness and thus influence attitudes to change consumption behavior and the real resources (targets 12.2, 12.5 and 12.8).

From the perspective of PE, an indirect relationship with the goals that compose SDG 12 could be considered. For example, the realization of educational activities and projects that aim to explain the cost of natural resources entails the disposal of sports materials. In addition, describing the environmental impact that a PA can cause in a natural environment (plastic bottles, packaging, etc.) could be a strategy to consider for responsible consumption awareness. However, these goals may not be regarded as the direct responsibility of the PE and maybe the education system’s responsibility in general.

3.8. SDG 13. Climate Action

The environmental problems suffered by humanity today have not only been collected in an SDG but are also dealt with in SDG 14 (Underwater life) and SDG 15 (Life terrestrial ecosystems). Specifically, the analyses performed have pointed exclusively to goal 13.1 and its relationship with sport and PA [14,15]. IBC does not relate to any of these SDG targets. Despite this, this institution points out how sports culture usually promotes environmental care in any media since it is a useful tool for educating and raising awareness among young people [17]. Despite this, this institution suggests how sports culture usually promotes environmental care in any way since it is a useful instrument to instruct and raise awareness among young people. In addition, MINEPS [15] emphasizes the value of sport in building resilience and capacity to adapt to risks related to climate and natural disasters (target 13.1). However, none of the approaches directly highlights the value of PE to work this SDG.

In the proposal presented, the PE possibilities for environmental care are considered since it is one of the main contents. For example, the direct relationship with target 13.3, which specifies the importance of education and awareness to avoid environmental problems, should be assessed. Some research has also shown PE students' opinions when practicing sports such as plogging, where they walk through different environments while collecting polluting waste [48]. Finally, institutions should consider reviewing SDGs 14 and 15 to analyze a potential relationship between sports and PE.
3.9. SDG 16. Peace, Justices and Strong Institutions

Conflict, insecurity or injustice are a severe threat to sustainable development [1]. The IBC [17] details that sport and PA can help reduce violence, improve unity, as well as promoting dialogue and social cohesion.

Therefore, the institutional analysis carried out shows that six of the targets proposed in this SDG have been generally related to sport, PE and P-A. Despite this, it can be seen that this SDG refers mainly to improving peace and justice in official organizations and institutions, and therefore is far from the potential influence of the PE, assuming that most of the targets do not have a clear relationship with the subject of the PE. While it is true that the practice of PE within the framework of activities that require cooperation and collaboration, such as sports, would help improve interpersonal relations among students[39], an indirect relationship could be established with goal 16.7.

In addition, this goal could also be related to applying the Personal and Social Responsibility Model, which has been considered a valid pedagogical model in PE for improving citizenship [49,50]. Finally, the practice of sports governed by rules can explain the importance of respecting operational standards in a community.

3.10. SDG 17. Partnership for the Goals

Finally, SDG 17 considers the importance of global cooperation and partnerships to achieve all the targets set in Agenda 2030[1]. Undoubtedly, concerning the values that sport or the PE represents, it can help contribute to emotional connections and encourage cooperative habits[17]. However, as in SDG 16, the specific analysis of the goals shows that this cooperation is mainly aimed at global institutions generating synergies that help achieve the SDGs, especially in developing countries. Therefore, although PE is a great tool to promote cooperation among equals, its influence would be far from being applied to the goals proposed by SDG 17.

As shown in this section 3, a new proposal of specific targets is suggested to PE by way of synthesis. From SDG 3, target 3.3 related to communicable disease transmission is proposed to be eliminated, and target 3.6 is integrated because road safety is a content that can be addressed from the PE. The rest of the proposed targets (3.4, 3.5 and 3.6) are maintained. About SDG4, it stays almost in its entirety except for target 4.b related to the assignment of scholarships to developing countries. A similar circumstance occurs with SDG5 since the proposed list of targets is accepted, except for target 5.3, which aims to avoid harmful practices such as child marriage. However, SDG8 has been limited since only two consider a relationship with the PE (8.3 and 8.9). In SDG10, the decision was made to eliminate goal 10.7, which is dedicated to facilitating migration and mobility. As with SDG 12, five of the six goals proposed remain (except 12.6). For SDG 13, the proposed goal is accepted, and it is suggested that 13.3 be added, which seeks to improve education for climate change. Concerning SDG 16, despite offering six proposed goals, 16.7 is the one that has been suggested with the potential to be worked on in the PE. Finally, SDG 11 and 17 have been eliminated because their goals have not been found to have transferable aspects to the PE.

4. Practice-Based Models, contents and SDGs. Working from Physical Education

Now that the first objective has been achieved, this critical review’s second objective was to relate the specific goals of the SDGs to different practice-based models. Achieving this objective is key because PE is characterized as a subject that offers a great methodological variety due to its content nature. This diversity of methodology leads to the appearance of different teaching models that have demonstrated their validity in PE. These models can be classified as basic as Cooperative Learning (CL), Sports Education Model (SE) or the model of Personal and Social Responsibility (PSR). Additionally, in recent years other emerging options have appeared such as Adventure Education (AE), Attitudinal Style (EA), Health Education (HE) or Self-construction of materials (SC).

4.1. Cooperative Learning
The approach to cooperative techniques from PE will allow personal skills that improve positive interdependence, social and group responsibilities, individual responsibilities and promote interaction[45,51,52]. Although CL techniques are not exclusively characteristic of PE, PE's nature implies greater contact and interaction means that the benefits of cooperation are multiplied[51,53].

Cooperative performance in PE could help contribute to the achievement of different goals. A clear relationship can be observed with goal 16.7, which aims to guarantee inclusive, participatory and representative decisions, characteristics that are intrinsic and specific to CL[52,53]. Another example occurs with goal 4.4, which deals with developing entrepreneurial competencies to facilitate employment access, with CL leading to developing important initiative and cooperation attitudes in students in job demands [54,55]. In addition, goal 4.5, focused on promoting equality for vulnerable people, can be worked on from the CL thanks to the fact that all participants in a cooperative group must value their colleagues' work to achieve a common goal [56,57]. Target 8.3 could be added to these suggestions since it also considers entrepreneurship, creativity and innovation in the business context, where the social and individual skills of PE acquire special significance [58,59].

4.2. Model of Personal and Social Responsibility

The PSR has been shown as a valid pedagogical model in PE to develop students' competencies related to individual and group responsibility [50,60]. Therefore, this model encourages respect, equality, or social values[47,61] to be connected to those SDG goals with similar objectives.

For example, social responsibility has been documented as a model that allows social awareness development regardless of gender[62]. Therefore, goals 5.1, 5.2, 5.5 and 5.c together seek to eliminate inequalities between men and women, and at the same time, promote and favor the empowerment of women and equal opportunities. Also, as was the case with the CL, the PSR will contribute in a direct way to develop people personal and social awareness [63], so it could also be related to the achievement of goal 16.7 to guarantee inclusive decisions and participatory, in addition to the goals proposed in SDG 10, such as 10.2 based on the social, economic and political inclusion of all people and 10.3 that aims to guarantee equal opportunities and reduce inequalities [60,61].

4.3. Sports Education Model

Since this model's main objective is to create a context that generates sports experiences as authentic as possible[44], it could be interesting to link it with those SDGs more related to employability. It must be borne in mind that sports, directly and indirectly, produce a significant amount of money and employment. For example, according to INE, sport in Spain accounts for 3.3% of GDP and more than 400,000 jobs, representing 2.1% of total employment [64]. In Europe, according to EU data, it represents 2.12% of GDP and 2.72% of jobs and at a global level 600,000 million a year, being 1.5% -2% of GDP worldwide [65].

One of the excellent characteristics of this model is the variety of roles it offers to students beyond the athlete's figure. For example, the role of the coach, physical trainer, journalist, marketing or different management positions, mediators, risk control, etc., can be implemented [44]. In addition to this multitude of functions, it is, of course, necessary to take into account the social and personal skills that this model entails, such as teamwork, the transfer of responsibilities, empathy and the promotion of autonomy [66].

Due to all these factors, the SDGs' goals could be related to this pedagogical model. For example, the two goals of SDG8, 8.3 on fostering entrepreneurship, creativity and innovation or 8.2, focused on achieving higher levels of economic productivity through diversification, technological modernization and innovation. In addition, target 4.4 aimed at improving skills to access employment, decent work and entrepreneurship. Finally, it should be noted that all those goals related to the development of socialization or respect
could also be worked on through this model; for example, goal 16.7 seeks to guarantee inclusive, participatory and representative decisions that respond to needs.

4.4. Adventure Education Model

This model arose to generate a learning context where interaction with the natural environment involves a series of elements of natural or fictitious risks [67]. This model has been related to green pedagogies, which involve a work philosophy that consists of the conception of the human being with an innate capacity to develop its full potential in interaction with the natural environment. In addition, Gehris et al. [68] pointed out that this model helps promote activities in natural environments in students' free time. In addition, the WHO points to PA's practice as an opportunity to produce care for the environment [25]. Therefore, it seems to indicate that PA's realization in natural surroundings promotes environmental care; thus, it could establish a relationship between some of the Adventure Education (AE), SDG, and different goals.

Although caring for the environment appears included in three SDGs (13.14 and 15), none of the reference institutions chose to relate to SDG 14 and 15. Therefore, from the proposed goals presented in this work, the relationship of the AE with goals 13.1, to strengthen the capacity to adapt to risks related to climate and natural disasters in all countries and 13.3 to improve education, awareness and human and institutional capacity regarding the mitigation of climate change. Additionally, the proposed goal 12.1 should be considered since it aims to manage natural resources sustainably and efficiently. Finally, goal 8.3 emphasizes the development of sustainable tourism that helps promote local culture, so as has been presented, the AE could contribute to this goal thanks to the promotion of PA in the natural environment with entails.

4.5. Self-Construction of Materials

The self-construction of materials has been a common way of working in PE for years, having, among other objectives, to develop an ecological conscience both in PE students and in the educational community [43]. In addition, the self-construction process of material has been documented as an ideal tool to develop the cooperation capacity and creativity of students [43], aspects highlighted in different goals of the SDGs.

For this reason, this emerging model could be related to the goals of SDG 13 (13.1 and 13.3) that generally defend the importance of respect for the environment or the reduction of the consequences of global warming. Additionally, the relationship of the materials self-construction model with SDG 12 and its goals 12.1 sustainable consumption and production, 12.2 efficient use of natural resources, 12.5 reduction of waste generation, or 12.8 aims to guarantee quality information is direct. To minimize promoting sustainable development.

Finally, the cooperative environment that is generated during the creation of a self-constructed material, as well as the creativity that this act entails, will enable the development of skills related to entrepreneurship (goal 4.4 and 8.3).

4.6. Health Education

Haerens et al., 2011 [69] pointed out the importance of conceiving PE not only as of the development of a set of skills but that health should be the center of the approach to the subject. Although this objective can be understood as basic or general of PE, this model focuses on affective and not only motor aspects. In this way, it will be possible to obtain greater regulation in PA outside the educational context. That is why Haerenes et al. [69] highlight the importance of conceiving this model with the idea of being a "lifelong learning".

Therefore, HE must be related to the goals that appear in SDG3 - Health and well-being, specifically the 3.4 Reduction of premature mortality and promotion of mental health and well-being 3.5 Reduction of addictive substance abuse. The positive effects of PE and PA on young people are well known because all the strategies aimed at promoting healthy habits, understood as understood as a habit or routine that is repeated regularly,
and an active occupation of free time will generate more vital, happier citizens with a high quality of life.

4.7. Beyond the Models, the Contents of PE

In addition, to the relationship between the proposed models, the nature of the PE and the contents that it is usually covered in its curriculum allows the development of different goals that have been selected in this proposal. For example, road safety education represented in target 3.6 has been included in some physical education curricula. This promotes the use of bicycles among students to contribute to sustainable and healthy mobility. On the other hand, although it is not included in any goal, it does speak in a general way in the SDG-4 of quality education. In this sense, it could be interesting to relate the neurocognitive and academic benefits of performing PA in a chronic [69,70] or acute way, for example, using active breaks as an educational tool [71,72].

In summary, for these models, it should be considered that not all of them will be able to contribute to obtaining the SDGs. However, the selection of goals that has been carried out has been regarded as the content that the PE works on, allowing a more significant contribution to the goals in the selected SDGs. For all these reasons, table 2, presented below, shows a synthesis of the 24 goals that can be worked on from the PE and the relationship with the different Models-Based Practice basic pedagogical and contents of the subject.

Table 2. Proposed relationship between Models-Based Practice and the specific targets of the SDGs suggested for Physical Education

<table>
<thead>

</table>
Therefore, the practical applications of the different contents worked on in the PE and the models based on the practice could be contributed to the specific goals of the 2030 Agenda directly and indirectly. For example, the development of environmental awareness and the sustainable use of resources through an adventure education model or the self-construction of materials; the development of virtues of cooperation, teamwork or respect thanks to the cooperative learning models and that of personal and social responsibility; work performance and entrepreneurship in an indirect way through the sports education model; or simply improving adherence to performing PA thanks to the health education model. This critical review will allow for action strategies to develop the SDGs in an educational context. It may also contribute to transferring these actions beyond the educational community. Critical (e.g. service-learning); and initial and permanent training qualified as an engine of change These aspects and those that go through defining realistic objectives and establishing verifiable results, indicators and sources of data, as well as ensuring that the objectives are in accordance with the available resources and developing a culture of institutional capacity to achieve said goals, will allow reaching more conclusions. Reliable how, where and why to invest to maximize contribution to development goals in a more general sense.

4. Conclusion

PE is a transcendental subject that could contribute to achieving the goals and objectives set out in the 2030 Agenda. Beyond the healthy virtues of PA and exercise, PE creates a context very favorable that allows the development of cooperation, respect, coeducation or entrepreneurship, all these aspects related to the development of the SDGs. However, regarding the first objective proposed in this research, it can be concluded that not all the SDGs’ goals can be implemented in PE, after our analysis, of the 169 goals proposed by UNESCO, only 24 are developed in PE classes. In relation to these 24 goals, and responding to the second objective of the research, it has been shown that most of them can be worked through the contents of PE. In addition, some practice-based models such as cooperative learning, the model of personal and social responsibility or the self-construction of materials will allow the development of more sustainable behaviors in young students. However, we believe that future research projects should be developed to facilitate the application of the SDGs in the educational context. For example, improving the ability to measure and evaluate the contribution of sport, PE, and PA to the SDGs will be key to ensuring that they occur. In relation to this idea, the Commonwealth, through UNESCO, published a practical guide and indicators to measure the contribution of sport, PE, and PA in achieving the SDGs. A similar analysis focused exclusively about PE will allow teachers to establish more stable criteria to develop the goals of the 2030 Agenda in a more specific way in the educational center. Simultaneously, it will make it possible to evaluate the degree of achievement of said goals, so it could be interesting to establish curricular links between the 17 SDGs and the different academic subjects. This data will allow more reliable conclusions to be reached on how, where and why to invest to maximize the contribution to development goals in a more general sense.
