15 Appendix A

16 Contents of this file: Appendix Figures A1 to A4; Tables A1

17 **Figure A1.** The thickness of the specimens as a function of the shear strain. The result includes
18 data from different CO₂ contents (4 %, 7 %, 14 %) and CO₂-free dunite. Gray circles are data from
19 Zhao et al. [1]. The green line is a least square fit to data from this work; the black line is a least
20 square fit to the data from Zhao et al. [1].

21 Water contents in the polycrystalline aggregates were determined by Fourier transform
22 infrared (FTIR) spectroscopy in transmission. To calculate hydroxyl concentration,
23 we integrated spectra between 3650 cm⁻¹ and 3000 cm⁻¹, which covered infrared hydroxyl
24 stretching bands for Ol, CPx, and OPx [1–4].

25 We examine the hot-pressed sample to obtain water contents that the thickness of
26 the sample wafer was 0.3 mm. The polycrystal of the hot-pressed sample (including grain
27 boundaries) contained ~9 ppm H₂O by weight (~150 H/10⁶ Si), indicate that olivine aggregates are
28 anhydrous prepared through this procedure. FTIR results are presented in Figure A2.

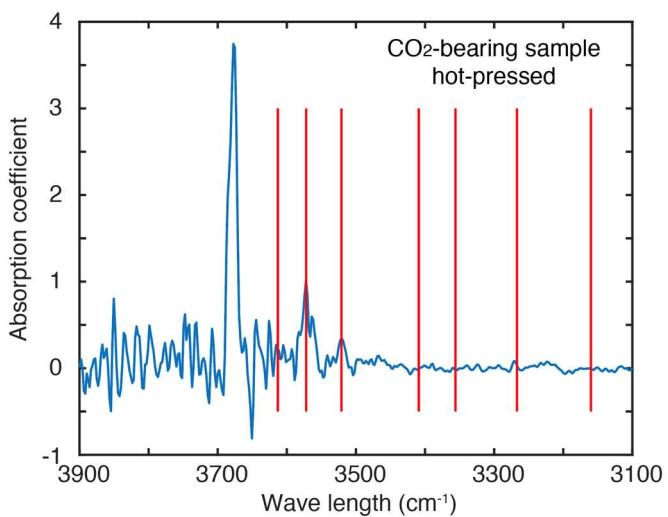

Figure A2. FTIR spectra from hot-pressed polycrystalline sample (W2261). The characteristic OH stretching bands in Ol (3613, 3572, 3521, 3409, 3356, 3267, 3160 cm^{-1}) were presented by solid red lines.

At our experiment condition (1 GPa and 1100°C), the system of Ol + CPx + CO_2 remains stable according to the solidus curve [5,6]. EMPA shows the composition of the starting sample and deformed sample. The results of Table A1 show the composition of the dark gray melt in Figures 2a and 2b and the light gray melt at Figure 2b, and the light gray melt between sample and piston (Figure A3). Images of Figure A3 obtained from initial sample not etched. According to Table A1, the light hollow on triple junctions is the Ca-rich carbonate melt and the anomalous dark mineral is the Mg-rich carbonate melt. From A3(a) and (b), the melt was aggregated to the boundary of the sample according to the EDS result (Ca).

Table A1. Summary of the EPMA

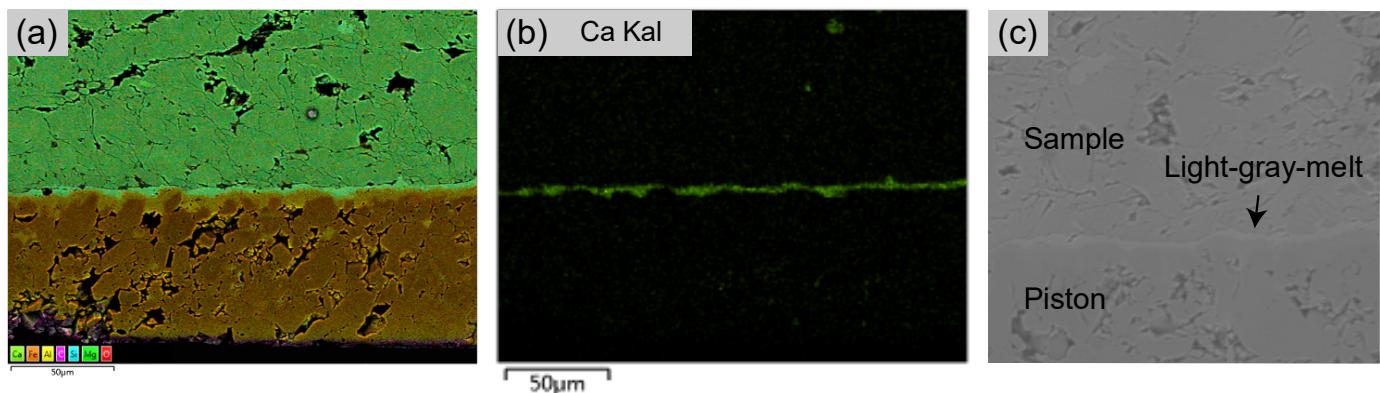

No.	CaO	MgO	FeO	SiO ₂	Al ₂ O ₃	Cr ₂ O ₃	TiO ₂	Na ₂ O	K ₂ O	MnO	NiO	CO_2	Total	Comment
W2261-light ¹ -gray-melt	48.17	7.21	1.54	5.84	0.00	0.00	0.00	0.01	0.01	0.03	0.05	37.17	100.00	Hot-pressed specimen

light¹: is the light triple junctions of Figure 2(b).

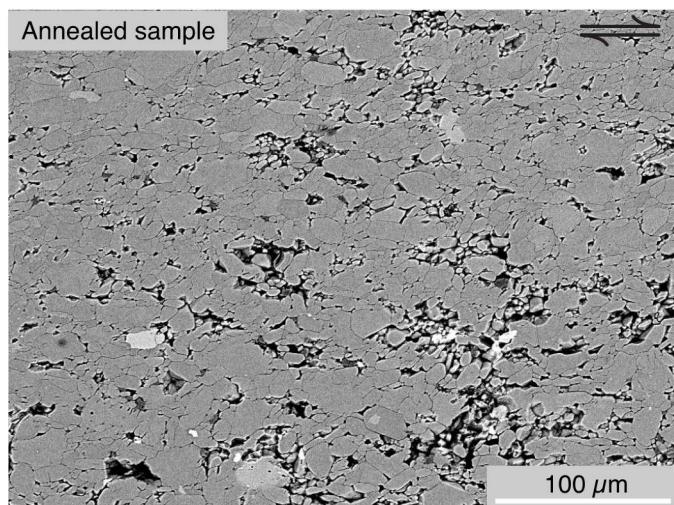

dark²: is the dark gray melt of Figure 2(a) and 2(b).

dark³: is the dark gray melt of deformed sample not etched.

light⁴: is the light gray melt between sample and piston of Figure A3(c).

47
48 **Figure A3.** The sample section for the deformed sample (W2264, not etched). (a) and (b) The en-
49 ergy-dispersive X-ray spectroscopy (EDS). (c) A BSE image. The composition of light-gray-melt
50 was analyzed by EPMA.

51
52 **Figure A4.** The BSE image of the annealed sample (W2266) with etched.
