Abstract

This article develops duality principles and related convex dual formulations suitable for the local and global optimization of non-convex primal formulations for a large class of models in physics and engineering. The results are based on standard tools of functional analysis, calculus of variations and duality theory. In particular, we develop applications to a Ginzburg-Landau type equation.

Key words: Convex dual variational formulation, duality principle for non-convex local primal optimization, Ginzburg-Landau type equation

MSC 49N15

1 Introduction

In this article we establish a duality principle and a related convex dual formulation suitable for the local optimization of the primal formulation for a large class of models in non-convex optimization.

The main duality principle is applied to the Ginzburg-Landau system in superconductivity in the absence of a magnetic field.

Such results are based on the works of J.J. Telega and W.R. Bielski [2, 3, 13, 14] and on a D.C. optimization approach developed in Toland [15].

About the other references, details on the Sobolev spaces involved are found in [1]. Related results on convex analysis and duality theory are addressed in [9, 5, 6, 7, 12]. Finally, similar models on the superconductivity physics may be found in [4, 11].

Remark 1.1. *It is worth highlighting, we may generically denote*

$$\int_\Omega [(-\gamma \nabla^2 + K I_d)^{-1} v^*] v^* \, dx$$

simply by

$$\int_\Omega \frac{(v^*)^2}{-\gamma\nabla^2 + K}\, dx,$$

where I_d denotes a concerning identity operator.

Other similar notations may be used along this text as their indicated meaning are sufficiently clear.

Finally, ∇^2 denotes the Laplace operator and for real constants $K_2 > 0$ and $K_1 > 0$, the notation $K_2 \gg K_1$ means that $K_2 > 0$ is much larger than $K_1 > 0$.

At this point we start to describe the primal and dual variational formulations.

Let $\Omega \subset \mathbb{R}^3$ be an open, bounded, connected set with a regular (Lipschitzian) boundary denoted by $\partial\Omega$.

For the primal formulation, consider a functional $J : V \to \mathbb{R}$ where

$$
\begin{aligned}
J(u) \;=\; & \frac{\gamma}{2}\int_\Omega \nabla u \cdot \nabla u\, dx \\
& + \frac{\alpha}{2}\int_\Omega (u^2 - \beta)^2\, dx - \langle u, f\rangle_{L^2}.
\end{aligned}
\tag{1}
$$

Here $\gamma > 0$, $\alpha > 0$, $\beta > 0$ and $f \in L^2(\Omega) \cap L^\infty(\Omega)$.

Moreover, $V = W_0^{1,2}(\Omega)$ and we denote $Y = Y^* = L^2(\Omega)$.

Define the functionals $F_1 : V \times Y \to \mathbb{R}$, $F_2 : V \to \mathbb{R}$ and $G : V \times Y \to \mathbb{R}$ by

$$
\begin{aligned}
F_1(u, v_0^*) \;=\; & \frac{\gamma}{2}\int_\Omega \nabla u \cdot \nabla u\, dx - \frac{K}{2}\int_\Omega u^2\, dx \\
& + \frac{K_1}{2}\int_\Omega (-\gamma\nabla^2 u + 2v_0^* u - f)^2\, dx + \frac{K_2}{2}\int_\Omega u^2\, dx,
\end{aligned}
\tag{2}
$$

$$F_2(u) = \frac{K_2}{2}\int_\Omega u^2\, dx$$

and

$$G(u, v) = \frac{\alpha}{2}\int_\Omega (u^2 - \beta + v)^2\, dx + \frac{K}{2}\int_\Omega u^2\, dx - \langle u, f\rangle_{L^2}.$$

We define also $F_1^* : [Y^*]^3 \to \mathbb{R}$, $F_2^* : Y^* \to \mathbb{R}$, and $G^* : [Y^*]^2 \to \mathbb{R}$, by

$$
\begin{aligned}
& F_1^*(v_2^*, v_1^*, v_0^*) \\
=\; & \sup_{u \in V}\{\langle u, v_1^* + v_2^*\rangle_{L^2} - F_1(u, v_0^*)\} \\
=\; & \int_\Omega \frac{-K_1 f(-\gamma\nabla^2 + K + K_2)f + (v_1^* + v_2^*)^2 - 2K_1 f(-\gamma\nabla^2 + 2v_0^*)(v_1^* + v_2^*)}{2[K_2 + K - \gamma\nabla^2 + K_1(-\gamma\nabla^2 + 2v_0^*)^2]}\, dx
\end{aligned}
\tag{3}
$$

$$
\begin{aligned}
F_2^*(v_2^*) \;=\; & \sup_{u \in V}\{\langle u, v_2^*\rangle_{L^2} - F_2(u)\} \\
=\; & \frac{1}{2K_2}\int_\Omega (v_2^*)^2\, dx
\end{aligned}
\tag{4}
$$

and

$$
\begin{aligned}
G^*(v_1^*, v_0^*) &= \sup_{(u,v)\in V\times Y} \{-\langle u, v_1^*\rangle_{L^2} + \langle v, v_0^*\rangle_{L^2} - G(u,v)\} \\
&= \frac{1}{2}\int_\Omega \frac{(v_1^* - f)^2}{2v_0^* + K}\, dx + \frac{1}{2\alpha}\int_\Omega (v_0^*)^2\, dx \\
&\quad + \beta \int_\Omega v_0^*\, dx
\end{aligned}
\tag{5}
$$

if $v_0^* \in B^*$ where

$$
B^* = \left\{ v_0^* \in Y^* \ : \ \|2v_0^*\|_\infty < K/8 \text{ and } -\gamma\nabla^2 + 2v_0^* < -\varepsilon I_d \right\},
$$

for a small parameter $0 < \varepsilon \ll 1$.

Furthermore, we define

$$
D^* = \{ v_1^* \in Y^* \ : \ \|v_1^*\|_\infty \le (3/2)K \}
$$

and $J_1^* : Y^* \times D^* \times B^* \to \mathbb{R}$, by

$$
J_1^*(v_2^*, v_1^*, v_0^*) = -F_1^*(v_2^*, v_1^*, v_0^*) + F_2^*(v_2^*) - G^*(v_1^*, v_0^*).
$$

Assuming

$$
K_2 \gg K_1 \gg K \gg \max\{\|f\|_\infty, \alpha, \beta, \gamma, 1/\varepsilon^2\}
$$

by directly computing $\delta^2 J_1^*(v_2^*, v_1^*, v_0^*)$ we may obtain that for such specified real constants, J_1^* in convex in v_2^* and it is concave in (v_1^*, v_0^*) on $Y^* \times D^* \times B^*$.

2   The main duality principle and a concerning convex dual formulation

Considering the statements and definitions presented in the previous section, we may prove the following theorem.

Theorem 2.1. *Let $(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*) \in Y^* \times D^* \times B^*$ be such that*

$$
\delta J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*) = \mathbf{0}
$$

and $u_0 \in V$ be such that

$$
u_0 = \frac{\partial F_2^*(\hat{v}_2^*)}{\partial v_2^*}.
$$

Under such hypotheses, we have

$$
\delta J(u_0) = \mathbf{0},
$$

and

$$
\begin{aligned}
J(u_0) &= \inf_{u\in V} \left\{ J(u) + \frac{K_1}{2}\int_\Omega (-\gamma\nabla^2 u + 2\hat{v}_0^* u - f)^2\, dx \right\} \\
&= \inf_{v_2^*\in Y^*} \left\{ \sup_{(v_1^*, v_0^*)\in D^*\times B^*} J_1^*(v_2^*, v_1^*, v_0^*) \right\} \\
&= J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*).
\end{aligned}
\tag{6}
$$

Proof. Observe that $\delta J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*) = \mathbf{0}$ so that, since J_1^* is convex in v_2^* and concave in (v_1^*, v_0^*) on $Y^* \times D^* \times B^*$, from the Min-Max theorem, we obtain

$$J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*) = \inf_{v_2^* \in Y^*} \left\{ \sup_{(v_1^*, v_0^*) \in D^* \times B^*} J_1^*(v_2^*, v_1^*, v_0^*) \right\}.$$

Now we are going to show that

$$\delta J(u_0) = \mathbf{0}.$$

From

$$\frac{\partial J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*)}{\partial v_2^*} = \mathbf{0},$$

and

$$\frac{\partial F_2^*(\hat{v}_2^*)}{\partial v_2^*} = u_0$$

we have

$$-\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, v_0^*)}{\partial v_2^*} + u_0 = \mathbf{0}$$

and

$$\hat{v}_2^* - K_2 u_0 = \mathbf{0}.$$

Observe now that denoting

$$H(v_2^*, v_1^*, v_0^*, u) = \langle u, v_1^* + v_2^* \rangle_{L^2} - F_1(u, v_0^*),$$

there exists $\hat{u} \in V$ such that

$$\frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{u})}{\partial u} = \mathbf{0},$$

and

$$F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*) = H(\hat{v}_1^*, \hat{v}_2^*, \hat{v}_0^*, \hat{u}),$$

so that

$$\begin{aligned}
\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*)}{\partial v_2^*} &= \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{u})}{\partial v_2^*} \\
&\quad + \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{u})}{\partial u} \frac{\partial \hat{u}}{\partial v_2^*} \\
&= \hat{u}.
\end{aligned} \tag{7}$$

Summarizing, we have got

$$u_0 = \frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*)}{\partial v_2^*} = \hat{u}.$$

Also, denoting

$$A(u_0, \hat{v}_0^*) = -\gamma \nabla^2 u_0 + 2\hat{v}_0^* u_0 - f,$$

from

$$\frac{\partial H(\hat{v}_1^*, \hat{v_2}^*, \hat{v}_0^*, u_0)}{\partial u} = \mathbf{0},$$

we have

$$-\hat{v}_1^* + Ku_0 + \gamma\nabla^2 u_0 + K_1(-\gamma\nabla^2 + 2\hat{v}_0^*)A(u_0, \hat{v}_0^*) - \hat{v}_2^* + K_2 u_0 = \mathbf{0},$$

so that

$$-\hat{v}_1^* + Ku_0 + \gamma\nabla^2 u_0 + K_1(-\gamma\nabla^2 + 2\hat{v}_0^*)A(u_0, \hat{v}_0^*) = \mathbf{0}. \tag{8}$$

From such results, we may infer that

$$
\begin{aligned}
&\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*)}{\partial v_1^*} \\
&= \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{u})}{\partial v_1^*} \\
&\quad + \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{u})}{\partial u}\frac{\partial \hat{u}}{\partial v_1^*} \\
&= \hat{u} \\
&= u_0.
\end{aligned}
\tag{9}
$$

Now observe that from the variation of J_1^* in v_1^*, we have

$$-\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*)}{\partial v_1^*} - \frac{\partial G^*(\hat{v}_1^*, \hat{v}_0^*)}{\partial v_1^*} = \mathbf{0}$$

so that

$$-u_0 - \frac{\partial G^*(\hat{v}_1^*, \hat{v}_0^*)}{\partial v_1^*} = \mathbf{0}$$

that is

$$-u_0 - \frac{\hat{v}_1^* - f}{2\hat{v}_0^* + K} = \mathbf{0}.$$

From this and (8), we may infer that

$$\hat{v}_1^* = -\gamma\nabla^2 u_0 - Ku_0 - K_1(-\gamma\nabla^2 + 2\hat{v}_0^*)A(u_0, \hat{v}_0^*) = -(2\hat{v}_0^* + K)u_0 + f,$$

so that

$$-\gamma\nabla^2 u_0 + 2\hat{v}_0^* u_0 - f - K_1(-\gamma\nabla^2 + 2\hat{v}_0^*)A(u_0, \hat{v}_0^*) = 0.$$

From this and the concerning boundary conditions, since

$$A(u_0, v_0^*) = -\gamma\nabla^2 u_0 + 2\hat{v}_0^* u_0 - f,$$

we may obtain

$$-\gamma\nabla^2 u_0 + 2\hat{v}_0^* u_0 - f = A(u_0, \hat{v}_0^*) = 0.$$

Moreover, from

$$\frac{\partial J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*)}{\partial v_0^*} = \mathbf{0},$$

we have

$$A(u_0, \hat{v}_0^*)2u_0 - \frac{\hat{v}_0^*}{\alpha} + u_0^2 - \beta = \mathbf{0},$$

so that

$$v_0^* = \alpha(u_0^2 - \beta).$$

From such last results we get

$$-\gamma\nabla^2 u_0 + 2\alpha(u_0^2 - \beta)u_0 - f = \mathbf{0},$$

and thus

$$\delta J(u_0) = \mathbf{0}.$$

Furthermore, also from such last results and the Legendre transform properties, we have

$$F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*) = \langle u_0, \hat{v}_2^* + \hat{v}_1^* \rangle_{L^2} - F_1(u_0, \hat{v}_0^*),$$

$$F_2^*(\hat{v}_2^*) = \langle u_0, \hat{v}_2^* \rangle_{L^2} - F_2(u_0),$$

$$G^*(\hat{v}_1^*, \hat{v}_0^*) = -\langle u_0, \hat{v}_1^* \rangle_{L^2} + \langle 0, \hat{v}_0^* \rangle_{L^2} - G(u_0, \mathbf{0}),$$

so that

$$
\begin{aligned}
&J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*) \\
&= -F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*) + F_2^*(\hat{v}_2^*) - G^*(\hat{v}_1^*, \hat{v}_0^*) \\
&= F_1(u_0, \hat{v}_0^*) - F_2(u_0) + G(u_0, \mathbf{0}) \\
&= J(u_0).
\end{aligned}
\tag{10}
$$

Finally, observe that

$$J_1^*(v_2^*, v_1^*, v_0^*) \le -\langle u, v_2^* \rangle_{L^2} + F_1(u, v_0^*) + F_2^*(v_2^*) + G(u, \mathbf{0}),$$

$\forall u \in V, \ v_2^* \in Y^*, \ v_1^* \in D^*, v_0^* \in B^*.$

Thus, we may obtain

$$
\begin{aligned}
&\inf_{v_2^* \in Y^*} J_1^*(v_2^*, \hat{v}_1^*, \hat{v}_0^*) \\
&\le \inf_{v_2^* \in Y^*} \{ -\langle u, v_2^* \rangle_{L^2} + F_1(u, \hat{v}_0^*) + F_2^*(v_2^*) + G(u, \mathbf{0}) \} \\
&= F_1(u, \hat{v}_0^*) - F_2(u) + G(u, \mathbf{0}) \\
&= J(u) + \frac{K_1}{2} \int_\Omega (-\gamma\nabla^2 u + 2\hat{v}_0^* u - f)^2 \, dx, \ \forall u \in V.
\end{aligned}
\tag{11}
$$

From this and (11), we obtain

$$
\begin{aligned}
&J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*) \\
&= \inf_{v_2^* \in Y^*} \left\{ \sup_{(v_1^*, v_0^*) \in D^* \times B^*} J_1^*(v_2^*, v_1^*, v_0^*) \right\} \\
&\le \inf_{u \in V} \left\{ J(u) + \frac{K_1}{2} \int_\Omega (-\gamma\nabla^2 u + 2\hat{v}_0^* u - f)^2 \, dx \right\}.
\end{aligned}
\tag{12}
$$

Joining the pieces, from a concerning convexity in u, we have got

$$
\begin{aligned}
J(u_0) &= \inf_{u \in V} \left\{ J(u) + \frac{K_1}{2} \int_\Omega (-\gamma\nabla^2 u + 2\hat{v}_0^* u - f)^2 \, dx \right\} \\
&= \inf_{v_2^* \in Y^*} \left\{ \sup_{(v_1^*, v_0^*) \in D^* \times B^*} J_1^*(v_2^*, v_1^*, v_0^*) \right\} \\
&= J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*).
\end{aligned}
\tag{13}
$$

The proof is complete.

<div style="text-align: right;">□</div>

Remark 2.2. *We could have also defined*

$$B^* = \left\{ v_0^* \in Y^* \ : \ \|2v_0^*\|_\infty < K/8 \ and \ -\gamma \nabla^2 + 2v_0^* > \varepsilon I_d \right\},$$

for a small parameter $0 < \varepsilon \ll 1$. This corresponds to $-\gamma \nabla^2 + 2v_0^*$ be positive definite, whereas the previous case corresponds to $-\gamma \nabla^2 + 2v_0^*$ be negative definite.

3 One more duality principle and a concerning convex dual variational formulation

In this section we establish a second duality principle and related convex dual formulation. Let $\Omega \subset \mathbb{R}^3$ be an open, bounded, connected set with a regular (Lipschitzian) boundary denoted by $\partial \Omega$.

For the primal formulation, consider a functional $J : V \to \mathbb{R}$ where

$$
\begin{aligned}
J(u) \ = \ & \frac{\gamma}{2} \int_\Omega \nabla u \cdot \nabla u \ dx \\
& + \frac{\alpha}{2} \int_\Omega (u^2 - \beta)^2 \ dx - \langle u, f \rangle_{L^2}.
\end{aligned}
\tag{14}
$$

Here $\gamma > 0$, $\alpha > 0$, $\beta > 0$ and $f \in L^2(\Omega) \cap L^\infty(\Omega)$.
Moreover, $V = W_0^{1,2}(\Omega)$ and we denote $Y = Y^* = L^2(\Omega)$.
Define the functionals $F_1 : V \times Y \to \mathbb{R}$, $F_2 : V \to \mathbb{R}$ and $G : V \times Y \to \mathbb{R}$ by

$$
\begin{aligned}
F_1(u, v_3^*) \ = \ & \frac{\gamma}{2} \int_\Omega \nabla u \cdot \nabla u \ dx - \frac{K}{2} \int_\Omega u^2 \ dx \\
& + \frac{K_1}{2} \int_\Omega (-\gamma \nabla^2 u + 2v_3^* u - h_1)^2 \ dx + \frac{K_2}{2} \int_\Omega u^2 \ dx,
\end{aligned}
\tag{15}
$$

$$F_2(u) = \frac{K_2}{2} \int_\Omega u^2 \ dx$$

and

$$G(u, v) = \frac{\alpha}{2} \int_\Omega (u^2 - \beta + v)^2 \ dx + \frac{K}{2} \int_\Omega u^2 \ dx - \langle u, f \rangle_{L^2},$$

for appropriate $\gamma_1 > 0$ and $h_1 \in L^2(\Omega)$ to be specified.

We define also $F_1^* : [Y^*]^3 \to \mathbb{R}$, $F_2^* : Y^* \to \mathbb{R}$, and $G^* : [Y^*]^2 \to \mathbb{R}$, by

$$
\begin{aligned}
& F_1^*(v_2^*, v_1^*, v_3^*) \\
= \ & \sup_{u \in V} \{ \langle u, v_1^* + v_2^* \rangle_{L^2} - F_1(u, v_3^*) \} \\
= \ & \frac{1}{2} \int_\Omega \frac{-h_1(-\gamma \nabla^2 - K + K_2)h_1 + (v_1^* + v_2^*)^2 + 2K_1 h_1(-\gamma_1 \nabla^2 + 2v_3^*)(v_1^* + v_2^*)}{-\gamma \nabla - K + K_1(-\gamma_1 \nabla^2 + 2v_3^*)^2 + K_2} \ dx,
\end{aligned}
$$

$$F_2^*(v_2^*) = \sup_{u \in V} \{\langle u, v_2^* \rangle_{L^2} - F_2(u)\}$$

$$= \frac{1}{2K_2} \int_\Omega (v_2^*)^2 \, dx \qquad (16)$$

and

$$G^*(v_1^*, v_0^*)$$
$$= \sup_{(u,v) \in V \times Y} \{\langle u, -v_1^* \rangle_{L^2} + \langle v, v_0^* \rangle_{L^2} - G(u,v)\}$$
$$= \frac{1}{2} \int_\Omega \frac{(v_1^* - f)^2}{2v_0^* + K} \, dx + \frac{1}{2\alpha} \int_\Omega (v_0^*)^2 \, dx + \beta \int_\Omega v_0^* \, dx \qquad (17)$$

if $v_0^* \in B^*$ where

$$B^* = \{v_0^* \in Y^* \ : \ \|2v_0^*\|_\infty < K/8\}.$$

Furthermore, we define

$$D^* = \{v_1^* \in Y^* \ : \ \|v_1^*\|_\infty \le (3/2)K\}$$

and $J_1^* : Y^* \times D^* \times B^* \times C^* \to \mathbb{R}$, by

$$J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) = -F_1^*(v_2^*, v_1^*, v_3^*) + F_2^*(v_2^*) - G^*(v_1^*, v_0^*).$$

where

$$C^* = \{v_3^* \in Y^* \ : \ -\gamma_1 \nabla^2 + 2v_3^* \ge K_3 I_d\}.$$

Observe that we may choose $\gamma_1 > 0$ and $h_1 \in L^2(\Omega)$ so that such a last constraint is satisfied by a critical point.

Moreover, assuming

$$K_1 \gg 1$$

and

$$K_2 \gg K_1 K_3^2 \gg K \gg \max\{1, \|f\|_\infty, \alpha, \beta, \gamma, \gamma_1\}$$

by directly computing $\delta^2 J_1^*(v_2^*, v_1^*, v_0^*, v_3^*)$ we may obtain that for such specified real constants, J_1^* in convex in v_2^* and it is concave in (v_1^*, v_0^*, v_3^*) on $Y^* \times D^* \times B^* \times C^*$.

3.1 The main duality principle and a related convex dual formulation

Considering the statements and definitions presented in the previous section, we may prove the following theorem.

Theorem 3.1. *Let* $(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) \in Y^* \times D^* \times B^* \times C^*$ *be such that*

$$\delta J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) = \mathbf{0}$$

and $u_0 \in V$ *be such that*

$$u_0 = \frac{\partial F_2^*(\hat{v}_2^*)}{\partial v_2^*}$$

where we assume

$$u_0 \neq 0, \ a.e. \ in \ \Omega.$$

Under such hypotheses, we have

$$\delta J(u_0) = \mathbf{0},$$

$$-\gamma_1 \nabla^2 u_0 + 2\hat{v}_3^* u_0 - h_1 = \mathbf{0},$$

and

$$
\begin{aligned}
J(u_0) &= \inf_{u \in V} \left\{ J(u) + \frac{K_1}{2} \int_\Omega (-\gamma_1 \nabla^2 u + 2\hat{v}_3^* u - h_1)^2 \, dx \right\} \\
&= \inf_{v_2^* \in Y^*} \left\{ \sup_{(v_1^*, v_0^*, v_3^*) \in D^* \times B^* \times C^*} J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \right\} \\
&= J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*).
\end{aligned}
\tag{18}
$$

Proof. Observe that $\delta J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) = \mathbf{0}$ so that, since J_1^* is convex in v_2^* and concave in (v_1^*, v_0^*, v_3^*) on $Y^* \times D^* \times B^* \times C^*$, from the Min-Max theorem, we obtain

$$J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) = \inf_{v_2^* \in Y^*} \left\{ \sup_{(v_1^*, v_0^*, v_3^*) \in D^* \times B^* \times C^*} J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \right\}.$$

Now we are going to show that

$$\delta J(u_0) = \mathbf{0}.$$

From

$$\frac{\partial J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*)}{\partial v_2^*} = \mathbf{0},$$

and

$$\frac{\partial F_2^*(\hat{v}_2^*)}{\partial v_2^*} = u_0$$

we have

$$-\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_2^*} + u_0 = \mathbf{0}$$

and

$$\hat{v}_2^* = K_2 u_0.$$

Observe now that

$$F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*) = \sup_{(u,v) \in V \times Y} \{ \langle u, v_1^* + v_2^* \rangle_{L^2} - F_1(u, v_3^*) \}.$$

Denoting

$$H(v_2^*, v_1^*, v_3^*, u) = \langle u, v_1^* + v_2^* \rangle_{L^2} - F_1(u, v_3^*),$$

there exists $\hat{u} \in V$ such that

$$\frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial u} = \mathbf{0},$$

and

$$F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*) = H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u}),$$

so that

$$\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_2^*} = \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial v_2^*}$$
$$+ \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial u}\frac{\partial \hat{u}}{\partial v_2^*}$$
$$= \hat{u}. \tag{19}$$

Summarizing, we have got

$$u_0 = \frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_2^*} = \hat{u}.$$

Furthermore,

$$\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_1^*} = \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial v_1^*}$$
$$+ \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial u}\frac{\partial \hat{u}}{\partial v_1^*}$$
$$= \hat{u}$$
$$= u_0. \tag{20}$$

From this and the variation of J_1^* in v_1^*, we obtain

$$-\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_1^*} - \frac{\partial G^*(\hat{v}_1^*, \hat{v}_0^*)}{\partial v_1^*} = \mathbf{0},$$

so that

$$-u_0 - \frac{\hat{v}_1^* - f}{2\hat{v}_0^* + K} = \mathbf{0}.$$

Hence

$$\hat{v}_1^* = -(2\hat{v}_0^* + K)u_0 + f.$$

Thus, from these last results and from the variation of J_1^* in v_3^*, we have

$$-\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_3^*} = K_1(-\gamma_1\nabla^2 u_0 + 2\hat{v}_3^* u_0 - h_1)2u_0 = \mathbf{0}.$$

Hence, since $u_0 \neq 0$, a.e. in Ω, we have got

$$-\gamma_1\nabla^2 u_0 + 2\hat{v}_3^* u_0 - h_1 = \mathbf{0}.$$

Moreover, from the variation of J_1^* in v_0^*, we obtain

$$-\frac{v_0^*}{\alpha} + u_0^2 - \beta = \mathbf{0},$$

so that

$$v_0^* = \alpha(u_0^2 - \beta).$$

Also from

$$\frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial u} = \mathbf{0},$$

so that

$$-\hat{v}_1^* - \gamma\nabla^2 u_0 - Ku_0 - \hat{v}_2^* + K_2 u_0 = \mathbf{0},$$

that is

$$\hat{v}_1^* = -\gamma\nabla^2 u_0 + Ku_0.$$

Thus,

$$\hat{v}_1^* = -\gamma\nabla^2 u_0 - Ku_0 = -(2v_0^* + K)u_0,$$

so that

$$-\gamma\nabla^2 u_0 + 2\hat{v}_0^* u_0 - f = \mathbf{0}.$$
$$-\gamma\nabla^2 u_0 + 2\alpha(u_0^2 - \beta)u_0 - f = \mathbf{0}.$$

From this, we may infer that

$$\delta J(u_0) = \mathbf{0}.$$

Furthermore, also from such last results and the Legendre transform properties, we have

$$F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*) = \langle u_0, \hat{v}_1^* + \hat{v}_2^*\rangle_{L^2} - F_1(u_0, \hat{v}_3^*),$$

$$F_2^*(\hat{v}_2^*) = \langle u_0, \hat{v}_2^*\rangle_{L^2} - F_2(u_0),$$

$$G^*(\hat{v}_1^*, \hat{v}_0^*) = \langle u_0, -\hat{v}_1^*\rangle_{L^2} + \langle 0, \hat{v}_0^*\rangle_{L^2} - G(u_0, \mathbf{0}),$$

so that

$$
\begin{aligned}
& J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) \\
=\ & -F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*) + F_2^*(\hat{v}_2^*) - G^*(\hat{v}_1^*, \hat{v}_0^*) \\
=\ & F_1(u_0, \hat{v}_3^*) - F_2(u_0) + G(u_0, \mathbf{0}) \\
=\ & J(u_0). \qquad\qquad (21)
\end{aligned}
$$

Finally, observe that

$$J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \le -\langle u, v_2^*\rangle_{L^2} + F_1(u, v_3^*) + F_2^*(v_2^*) + G(u, \mathbf{0}),$$

$\forall u \in V,\ v_2^* \in Y^*,\ v_1^* \in D^*, v_0^* \in B^*,\ v_3^* \in C^*,.$

Thus, we may obtain

$$
\begin{aligned}
& \inf_{v_2^* \in Y^*} J_1^*(v_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) \\
\le\ & \inf_{v_2^* \in Y^*} \{-\langle u, v_2^*\rangle_{L^2} + F_1(u, \hat{v}_3^*) + F_2^*(v_2^*) + G(u, \mathbf{0})\} \\
=\ & F_1(u, \hat{v}_3^*) - F_2(u) + G(u, \mathbf{0}) \\
=\ & J(u) + \frac{K_1}{2}\int_\Omega (-\gamma_1\nabla^2 u + 2\hat{v}_3^* u - h_1)^2\, dx,\ \forall u \in V. \qquad (22)
\end{aligned}
$$

From this, we obtain

$$
\begin{aligned}
& J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) \\
=\ & \inf_{v_2^* \in Y^*} \left\{ \sup_{(v_1^*, v_0^*, v_3^*) \in D^* \times B^* \times C^*} J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \right\} \\
\le\ & \inf_{u \in V} \left\{ J(u) + \frac{K_1}{2}\int_\Omega (-\gamma_1\nabla^2 u + 2\hat{v}_3^* u - h)^2\, dx \right\}. \qquad (23)
\end{aligned}
$$

Joining the pieces, from a concerning convexity in u, we have got

$$
\begin{aligned}
J(u_0) &= \inf_{u \in V} \left\{ J(u) + \frac{K_1}{2} \int_\Omega (-\gamma_1 \nabla^2 u + 2\hat{v}_3^* u - h_1)^2 \, dx \right\} \\
&= \inf_{v_2^* \in Y^*} \left\{ \sup_{(v_1^*, v_0^*, v_3^*) \in D^* \times B^* \times C^*} J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \right\} \\
&= J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*).
\end{aligned}
\tag{24}
$$

The proof is complete.

□

4 One more duality principle and a concerning convex dual variational formulation suitable for global optimization of the primal formulation

In this section we establish a third duality principle and related convex dual formulation. Let $\Omega \subset \mathbb{R}^3$ be an open, bounded, connected set with a regular (Lipschitzian) boundary denoted by $\partial\Omega$.

For the primal formulation, consider a functional $J : V \to \mathbb{R}$ where

$$
\begin{aligned}
J(u) &= \frac{\gamma}{2} \int_\Omega \nabla u \cdot \nabla u \, dx \\
&\quad + \frac{\alpha}{2} \int_\Omega (u^2 - \beta)^2 \, dx - \langle u, f \rangle_{L^2}.
\end{aligned}
\tag{25}
$$

Here $\gamma > 0$, $\alpha > 0$, $\beta > 0$ and $f \in L^2(\Omega) \cap L^\infty(\Omega)$.

Moreover, $V = W_0^{1,2}(\Omega)$ and we denote $Y = Y^* = L^2(\Omega)$.

Define the functionals $F_1 : V \times Y \to \mathbb{R}$, $F_2 : V \to \mathbb{R}$ and $G : V \times Y \to \mathbb{R}$ by

$$
\begin{aligned}
F_1(u, v_3^*) &= \frac{\gamma}{2} \int_\Omega \nabla u \cdot \nabla u \, dx - \frac{K}{2} \int_\Omega u^2 \, dx \\
&\quad + \frac{K_1}{2} \int_\Omega (v_3^* K_2 u - K_2)^2 \, dx + \frac{K_2}{2} \int_\Omega u^2 \, dx,
\end{aligned}
\tag{26}
$$

$$
F_2(u) = \frac{K_2}{2} \int_\Omega u^2 \, dx
$$

and

$$
G(u, v) = \frac{\alpha}{2} \int_\Omega (u^2 - \beta + v)^2 \, dx + \frac{K}{2} \int_\Omega u^2 \, dx - \langle u, f \rangle_{L^2}.
$$

We define also $F_1^* : [Y^*]^3 \to \mathbb{R}$, $F_2^* : Y^* \to \mathbb{R}$, and $G^* : [Y^*]^2 \to \mathbb{R}$, by

$$
\begin{aligned}
&F_1^*(v_2^*, v_1^*, v_3^*) \\
&= \sup_{u \in V} \{ \langle u, v_1^* + v_2^* \rangle_{L^2} - F_1(u, v_3^*) \}
\end{aligned}
\tag{27}
$$

$$F_2^*(v_2^*) = \sup_{u \in V}\{\langle u, v_2^*\rangle_{L^2} - F_2(u)\}$$

$$= \frac{1}{2K_2}\int_\Omega (v_2^*)^2\, dx \tag{28}$$

and

$$G^*(v_1^*, v_0^*)$$

$$= \sup_{(u,v)\in V\times Y}\{\langle u, -v_1^*\rangle_{L^2} + \langle v, v_0^*\rangle_{L^2} - G(u,v)\}$$

$$= \frac{1}{2}\int_\Omega \frac{(v_1^* - f)^2}{2v_0^* + K}\, dx + \frac{1}{2\alpha}\int_\Omega (v_0^*)^2\, dx + \beta\int_\Omega v_0^*\, dx \tag{29}$$

if $v_0^* \in B^*$ where

$$B^* = \{v_0^* \in Y^* \ : \ \|2v_0^*\|_\infty < K/8\}.$$

Furthermore, we define

$$D^* = \{v_1^* \in Y^* \ : \ \|v_1^*\|_\infty \le (3/2)K\}$$

and $J_1^* : Y^* \times D^* \times B^* \times C^* \to \mathbb{R}$, by

$$J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) = -F_1^*(v_2^*, v_1^*, v_3^*) + F_2^*(v_2^*) - G^*(v_1^*, v_0^*).$$

where

$$C^* = \{v_3^* \in Y^* \ : \ \|v_3^*\|_\infty \le (3/2)K\}.$$

Here we emphasize that C^* is a convex set.

Moreover, assuming

$$K_2 \gg K_1 \gg K \gg \max\{1, \|f\|_\infty, \alpha, \beta, \gamma\}$$

by directly computing $\delta^2 J_1^*(v_2^*, v_1^*, v_0^*, v_3^*)$ we may obtain that for such specified real constants, J_1^* in convex in (v_2^*, v_3^*) and it is concave in (v_1^*, v_0^*) on $Y^* \times C^* \times D^* \times B^*$.

4.1   The main duality principle and a related convex dual formulation

Considering the statements and definitions presented in the previous section, we may prove the following theorem.

Theorem 4.1. *Let* $(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) \in Y^* \times D^* \times B^* \times C^*$ *be such that*

$$\delta J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) = \mathbf{0}$$

and $u_0 \in V$ *be such that*

$$u_0 = \frac{\partial F_2^*(\hat{v}_2^*)}{\partial v_2^*}$$

where we assume

$$u_0 \ne 0, \ a.e. \ in \ \Omega.$$

Under such hypotheses, we have

$$\delta J(u_0) = \mathbf{0},$$

$$\hat{v}_3 K_2 u_0 - K_2 = \mathbf{0},$$

and

$$
\begin{aligned}
J(u_0) &= \inf_{u \in V} \{J(u)\} \\
&= \inf_{(v_2^* \times v_3^*) \in Y^* \times C^*} \left\{ \sup_{(v_1^*, v_0^*) \in D^* \times B^*} J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \right\} \\
&= J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*).
\end{aligned}
\tag{30}
$$

Proof. Observe that $\delta J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) = \mathbf{0}$ so that, since J_1^* is convex in (v_2^*, v_3^*) and concave in (v_1^*, v_0^*) on $Y^* \times C^* \times D^* \times B^*$, from the Min-Max theorem, we obtain

$$J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) = \inf_{(v_2^*, v_3^*) \in Y^* \times C^*} \left\{ \sup_{(v_1^*, v_0^*) \in D^* \times B^*} J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \right\}.$$

Now we are going to show that

$$\delta J(u_0) = \mathbf{0}.$$

From

$$\frac{\partial J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*)}{\partial v_2^*} = \mathbf{0},$$

and

$$\frac{\partial F_2^*(\hat{v}_2^*)}{\partial v_2^*} = u_0$$

we have

$$-\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_2^*} + u_0 = \mathbf{0}$$

and

$$\hat{v}_2^* = K_2 u_0.$$

Observe now that

$$F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*) = \sup_{(u,v) \in V \times Y} \{\langle u, v_1^* + v_2^* \rangle_{L^2} - F_1(u, v_3^*)\}.$$

Denoting

$$H(v_2^*, v_1^*, v_3^*, u) = \langle u, v_1^* + v_2^* \rangle_{L^2} - F_1(u, v_3^*),$$

there exists $\hat{u} \in V$ such that

$$\frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial u} = \mathbf{0},$$

and

$$F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*) = H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u}),$$

so that

$$
\begin{aligned}
\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_2^*} &= \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial v_2^*} \\
&\quad + \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial u} \frac{\partial \hat{u}}{\partial v_2^*} \\
&= \hat{u}.
\end{aligned}
\tag{31}
$$

Summarizing, we have got

$$
u_0 = \frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_2^*} = \hat{u}.
$$

Furthermore,

$$
\begin{aligned}
\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_1^*} &= \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial v_1^*} \\
&\quad + \frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial u} \frac{\partial \hat{u}}{\partial v_1^*} \\
&= \hat{u} \\
&= u_0.
\end{aligned}
\tag{32}
$$

From this and the variation of J_1^* in v_1^*, we obtain

$$
-\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_1^*} - \frac{\partial G^*(\hat{v}_1^*, \hat{v}_0^*)}{\partial v_1^*} = \mathbf{0},
$$

so that

$$
-u_0 - \frac{\hat{v}_1^* - f}{2\hat{v}_0^* + K} = \mathbf{0}.
$$

Hence

$$
\hat{v}_1^* = -(2\hat{v}_0^* + K)u_0 + f.
$$

Thus, from these last results and from the variation of J_1^* in v_3^*, we have

$$
-\frac{\partial F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*)}{\partial v_3^*} = K_1(\hat{v}_3^* K_2 u_0 - K_2) K_2 u_0 = \mathbf{0}.
$$

Hence, since $u_0 \neq 0$ a.e. in Ω, we have got

$$
\hat{v}_3^* K_2 u_0 - K_2 = \mathbf{0}.
$$

Moreover, from the variation of J_1^* in v_0^*, we obtain

$$
-\frac{v_0^*}{\alpha} + u_0^2 - \beta = \mathbf{0},
$$

so that

$$
v_0^* = \alpha(u_0^2 - \beta).
$$

Also from

$$
\frac{\partial H(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*, \hat{u})}{\partial u} = \mathbf{0},
$$

so that
$$-\hat{v}_1^* - \gamma\nabla^2 u_0 - Ku_0 - \hat{v}_2^* + K_2 u_0 = \mathbf{0},$$

that is
$$\hat{v}_1^* = -\gamma\nabla^2 u_0 + Ku_0.$$

Thus,
$$\hat{v}_1^* = -\gamma\nabla^2 u_0 - Ku_0 = -(2v_0^* + K)u_0,$$

so that
$$-\gamma\nabla^2 u_0 + 2\hat{v}_0^* u_0 - f = \mathbf{0}.$$
$$-\gamma\nabla^2 u_0 + 2\alpha(u_0^2 - \beta)u_0 - f = \mathbf{0}.$$

From this, we may infer that
$$\delta J(u_0) = \mathbf{0}.$$

Furthermore, also from such last results and the Legendre transform properties, we have
$$F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*) = \langle u_0, \hat{v}_1^* + \hat{v}_2^* \rangle_{L^2} - F_1(u_0, \hat{v}_3^*),$$

$$F_2^*(\hat{v}_2^*) = \langle u_0, \hat{v}_2^* \rangle_{L^2} - F_2(u_0),$$

$$G^*(\hat{v}_1^*, \hat{v}_0^*) = \langle u_0, -\hat{v}_1^* \rangle_{L^2} + \langle 0, \hat{v}_0^* \rangle_{L^2} - G(u_0, \mathbf{0}),$$

so that
$$
\begin{aligned}
J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) \\
= \quad & -F_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_3^*) + F_2^*(\hat{v}_2^*) - G^*(\hat{v}_1^*, \hat{v}_0^*) \\
= \quad & F_1(u_0, \hat{v}_3^*) - F_2(u_0) + G(u_0, \mathbf{0}) \\
= \quad & J(u_0).
\end{aligned}
\tag{33}
$$

Finally, observe that
$$J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \le -\langle u, v_2^* \rangle_{L^2} + F_1(u, v_3^*) + F_2^*(v_2^*) + G(u, \mathbf{0}),$$
$\forall u \in V,\ v_2^* \in Y^*,\ v_1^* \in D^*, v_0^* \in B^*,\ v_3^* \in C^*,$.

Thus, we may obtain
$$
\begin{aligned}
\inf_{(v_2^*, v_3^*) \in Y^* \times C^*} & J_1^*(v_2^*, \hat{v}_1^*, \hat{v}_0^*, v_3^*) \\
\le \quad & \inf_{(v_2^*, v_3^*) \in Y^*} \{-\langle u, v_2^* \rangle_{L^2} + F_1(u, v_3^*) + F_2^*(v_2^*) + G(u, \mathbf{0})\} \\
= \quad & \frac{\gamma}{2}\int_\Omega \nabla u \cdot \nabla u \, dx - \frac{K}{2}\int_\Omega u^2 \, dx + F_2(u) - F_2(u) + G(u, \mathbf{0}) \\
= \quad & J(u),\ \forall u \in V.
\end{aligned}
\tag{34}
$$

From this, we obtain
$$
\begin{aligned}
J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*) \\
= \quad & \inf_{(v_2^*, v_3^*) \in Y^* \times C^*} \left\{ \sup_{(v_1^*, v_0^*) \in D^* \times B^*} J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \right\} \\
\le \quad & \inf_{u \in V} \{J(u)\}.
\end{aligned}
\tag{35}
$$

Joining the pieces, we have got

$$
\begin{aligned}
J(u_0) &= \inf_{u \in V} \{J(u)\} \\
&= \inf_{(v_2^*, v_3^*) \in Y^* \times C^*} \left\{ \sup_{(v_1^*, v_0^*) \in D^* \times B^*} J_1^*(v_2^*, v_1^*, v_0^*, v_3^*) \right\} \\
&= J_1^*(\hat{v}_2^*, \hat{v}_1^*, \hat{v}_0^*, \hat{v}_3^*).
\end{aligned}
\tag{36}
$$

The proof is complete.

$\square$

5　Conclusion

In this article we have developed convex dual variational formulations suitable for the local optimization of non-convex primal formulations.

It is worth highlighting, the results may be applied to a large class of models in physics and engineering.

We also emphasize the duality principles here presented are applied to a Ginzburg-Landau type equation. In a future research, we intend to extend such results for some models of plates and shells and other models in the elasticity theory.
