12.QM-NMR calculation

Torsional sampling (MCM) conformational searches using OPLS_2005 force field were carried out by the means of conformational search module in Macro model 9.9.223 software (Schrodinger, <http://www.schrodinger.com/MacroModel>), applying an energy window of 21 kJ/mol (5.02 kcal/mol) for saving structures. Conformers above 1% population were re-optimized with Gaussian 09 at the B3LYP/6-311G(d,p) level with IEFPCM solvent model for acetonitrile.

The following DFT calculations were performed using Gaussian 09, and the dominant conformers were re-optimized at B3LYP/6-311G(d,p) level of theory. Magnetic shielding constants (σ) were calculated by means of the gauge including atomic orbitals (GIAO) method at mPW1PW91/6-31 G(d) level of theory as recommended for DP4+ analysis.

13. TDDFT-ECD calculation

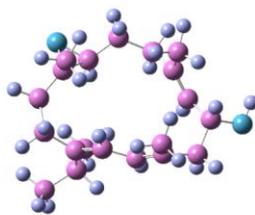

Conformational searches were done following the general protocols previously described for DP4+ calculation. For the resulting geometries, ECD spectra were obtained by TDDFT calculations performed with the same functional, basis set and solvent model as the energy optimization. Finally, the Boltzmann-averaged ECD spectra of **3**, **4**, **5** was obtained with SpecDis1.62 software.

Re-optimized conformers of (6*R*, 11*S*, 12*S*)-**3**, (5*S*, 11*R*, 12*R*)-**4** and (5*S*, 11*R*, 12*R*)-**5** calculated at the B3LYP/6-311G(d,p) level with IEFPCM solvent model for acetonitrile.
