**Abstract:** Incorporating the effective speed of light, rather than the conventional constant  $c$ , into the four-velocity vector leads to a more physically meaningful expression for the momentum and energy of stationary objects in Schwarzschild spacetime. This indicates that free-falling objects do not gain any energy in the gravitational field; instead, they experience a conversion of rest energy into kinetic energy within the specific spacetime structure. This innovative approach allows us to dispense with the traditional concept of gravitational potential energy, simplifying energy transformations within gravitational fields.

**Keywords:** four-velocity vector; effective speed of light; energy transformation

## 1. Introduction

The four-velocity vector in special relativity is defined as [1], (p.10):

$$U^{\mu} = \left( c \frac{dt}{d\tau}, \frac{dx}{d\tau}, \frac{dy}{d\tau}, \frac{dz}{d\tau} \right) \quad (1)$$

The Schwarzschild solution for Einstein field equations is [1, p.47]:

$$ds^2 = - \left( 1 - \frac{r_s}{r} \right) c^2 dt^2 + \left( 1 - \frac{r_s}{r} \right)^{-1} dr^2 + r^2 (d\theta^2 + \sin^2 \theta d\phi^2) \quad (2)$$

Where  $r_s = 2GM/c^2$  is the Schwarzschild radius. To generalize the four-velocity vector from Eq. (1) to Schwarzschild spacetime, we must consider every factor in both Eq. (1) and Eq. (2). To simplify the problem, we only consider stationary objects.

## 2. Metric Modification

For a stationary object, we only need to consider the  $U^0$ . Therefore, we attempt to modify the  $dt/d\tau$ . According to Eq. (2), for a stationary object,  $dr = 0, d\theta = 0, d\phi = 0$ . Thus:

$$ds^2 = - \left( 1 - \frac{r_s}{r} \right) c^2 dt^2 \quad (3)$$

For a time-like path  $ds^2 = -c^2 d\tau^2$ . Thus, we have [1, p.20]:

$$d\tau = dt \sqrt{1 - \frac{r_s}{r}} \quad (4)$$

Substituting Eq. (4) into Eq. (1), we obtain  $U^0$  as:

$$U^0 = c \frac{dt}{d\tau} = \frac{c}{\sqrt{1 - \frac{r_s}{r}}} \quad (5)$$

Eq.(5), which could be derived from [2], (p.48, Eq.3.5), is commonly presented in traditional general relativity textbooks. It predicts an increase in rest energy within Schwarzschild spacetime, leading to

the introduction of gravitational potential energy to explain energy transformations in gravitational fields. However, we will demonstrate that this interpretation is misleading because the consideration of the speed of light  $c$  has been neglected in both Eq. 5 and [2], (p. 48, Eq. 3.5).

### 3. Consideration of the Significance of $c$ in $U^0$

According to Eq. (1), all the components of  $U^\mu$  are defined by derivatives with respect to  $d\tau$ . Specifically, in  $U^0$  the speed of light  $c$  is multiplied by the ratio  $dt/d\tau$ . This implies we should use a speed of light that is also defined with respect to  $d\tau$ . Consequently, all the components of the four-velocity vector are expressed in a unified reference frame.

#### 3.1. Incorporating the Effective Speed of Light into the Four-Velocity Vector

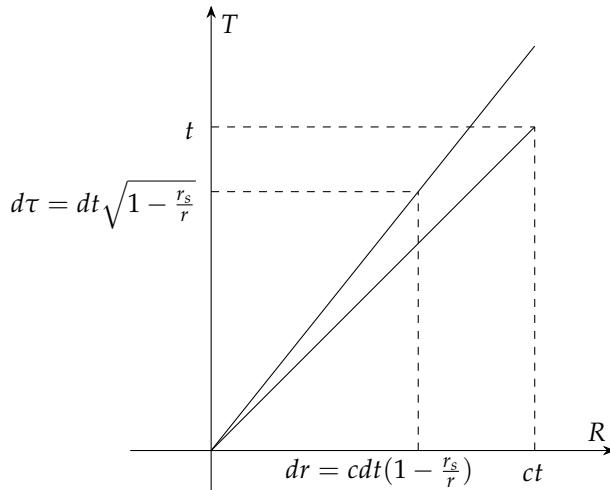

Let's examine the effective speed of light in Eq. (2), under the conditions  $d\tau = 0, d\theta = 0, d\phi = 0$ . For a time-like path  $ds^2 = -c^2 d\tau^2$ , we can derive the following:

$$\frac{dr}{dt} = c \left(1 - \frac{r_s}{r}\right) \quad (6)$$

Eq. (6) indicates that for a far-away observer in a given time  $dt$  the path length of light in Schwarzschild spacetime is not  $cdt$ , but rather  $c(1 - \frac{r_s}{r})dt$ . On the other hand, according to Eq. (4) the proper time of a stationary object in the same given time is  $dt\sqrt{1 - \frac{r_s}{r}}$ . So, we can derive the effective speed of light as:

$$C_e = \frac{dr}{d\tau} = \frac{c(1 - \frac{r_s}{r})dt}{dt\sqrt{1 - \frac{r_s}{r}}} = c\sqrt{1 - \frac{r_s}{r}} \quad (7)$$

As shown in Figure 1 the speed of light in a flat spacetime is  $c = ct/t$ , which defines the worldline of light. The effective speed of light in Schwarzschild spacetime is slower than that in flat spacetime, which defines the worldline of light in Schwarzschild spacetime.

**Figure 1.** The effective speed of light in Schwarzschild spacetime.

Apply this metric modification to the speed of light  $c$ , denoted  $C_e$  in the Eq. (5), we obtain the new definition of  $U^0$  in the four-velocity vector in Schwarzschild spacetime as:

$$U^0 = \frac{C_e}{\sqrt{1 - \frac{r_s}{r}}} = \frac{c\sqrt{1 - \frac{r_s}{r}}}{\sqrt{1 - \frac{r_s}{r}}} = c \quad (8)$$

For a stationary object in Schwarzschild spacetime, we thus have  $U^\mu$  as:

$$U^\mu = (c, 0, 0, 0) \quad (9)$$

This is the four-velocity vector of a stationary object in Schwarzschild spacetime, derived through rigorous mathematical analysis that accounts for the effective speed of light.

### 3.2. Momentum and Rest Energy

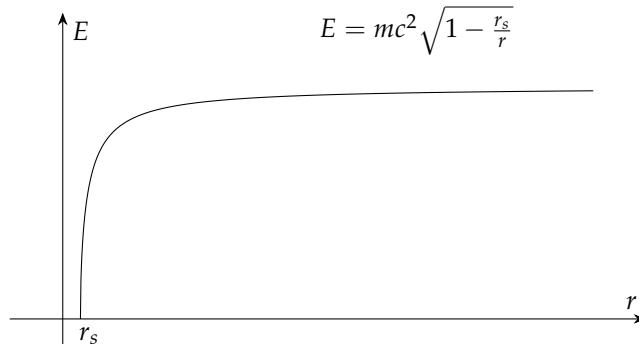

According to the Eq. (9), the momentum of a stationary object can be calculated as:

$$P^\mu = (mc, 0, 0, 0) \quad (10)$$

As we know in relativity  $P^0 = E/C$ , but in case of Schwarzschild spacetime, the effective speed of light is not  $c$  but  $C_e$  in Eq.(7). Therefore, the rest energy of a stationary object in Schwarzschild spacetime is:

$$E = P^0 * C_e = mc * c \sqrt{1 - \frac{r_s}{r}} = mc^2 \sqrt{1 - \frac{r_s}{r}} \quad (11)$$

Eq. (11) indicates that the rest energy of a stationary object in Schwarzschild spacetime will decrease as it gets closer to the singularity, as shown in Figure 2. According to the law of conservation of energy, the lost rest energy is converted into kinetic energy during the process of free fall. That suggests a fundamental difference in energy transformation between an object continuously accelerating due to an external force in flat spacetime and an object continuously accelerating due to spacetime curvature in a gravitational field. The former has its kinetic energy increased by the work done by other objects without losing rest energy. The latter, on the other hand, does not gain energy but rather experiences a conversion of rest energy into kinetic energy under a specific spacetime structure.

**Figure 2.** The rest energy of a stationary object in Schwarzschild spacetime decreases when getting closer to the singularity.

Why must an object's rest energy decrease in a gravitational field? This can be understood by examining how the object's electromagnetic energy changes within such a field. It is known that in a gravitational field, the electric field strength generated by a given amount of energy increases [2], (p. 121–123). To maintain a stable energy-state structure in Schwarzschild spacetime, this excess energy must be transformed into another form. A similar situation occurs with energies dominated by the other two fundamental forces to preserve the internal structure of the object within the gravitational field unchanged. This results in an energy gradient where the object's rest energy in Schwarzschild spacetime decreases as  $r$  decreases. This energy gradient is the source of gravitation.

In the reverse process, an object is lifted in the gravitational field. By obtaining the work done by other objects, the lifted object gains energy and is able to establish a stable internal structure and energy level at a location farther away from the singularity.

### 3.3. Kinetic Energy and Gravitation

According to the analysis in Section 3.2, objects in Schwarzschild spacetime are not subject to any traditional forces but experience a transformation of energy forms in special spacetime geometry. To determine the force experienced by an object in Schwarzschild spacetime due to this energy transformation, we attempt to derive the force acting on the object using the kinetic energy formula. According to Eq. (11), the kinetic energy  $E_k$  of an object in free fall in Schwarzschild spacetime is defined as the difference between the rest energy in flat spacetime and the rest energy in Schwarzschild spacetime.

$$E_k = mc^2 \left( 1 - \sqrt{1 - \frac{r_s}{r}} \right) \quad (12)$$

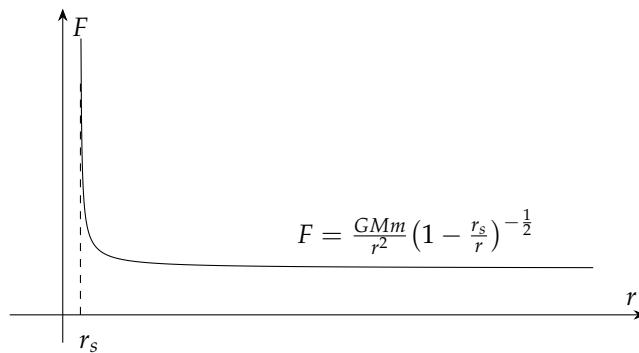

According to the definition of work, force is the derivative of kinetic energy with respect to distance.

$$F = \frac{dE_k}{dr} = -\frac{mc^2 r_s}{r^2} \frac{1}{\sqrt{1 - \frac{r_s}{r}}} \quad (13)$$

This indicates a force opposite to the direction of  $r$ . Considering  $r_s = 2GM/c^2$ , we can get a more familiar equation for the force:

$$|F| = \frac{GMm}{r^2} \left( 1 - \frac{r_s}{r} \right)^{-\frac{1}{2}} \quad (14)$$

As shown in Figure 3 the force experienced by an object in Schwarzschild spacetime will increase as it approaches the singularity. On the other hand, as  $r \rightarrow \infty$ , Eq. (14) reduces to Newton's law for universal gravitation.

**Figure 3.** The force experienced by an object in Schwarzschild spacetime increases when getting close to the singularity.

## 4. Results

In this paper, we explore the modifications necessary to extend the definition of the four-velocity vector from special to general relativity. We have derived a more plausible expression for the momentum and energy of stationary objects in Schwarzschild spacetime. This result reveals that a free-falling object, continuously accelerating due to spacetime curvature in a gravitational field, experiences a conversion of rest energy into kinetic energy. Introducing the concept of gravitational potential energy is unnecessary. Instead, it is essential to incorporate the effective speed of light into the four-velocity vector. This approach necessitates re-examining all general relativity calculations that involve the speed of light. Our work contributes to a deeper understanding of the interplay between energy and gravitation, paving the way for future explorations within the framework of general relativity.
